безопасность : учебное пособие / К . В. Абазова, М . К. Бо-
риева, А. А. Текуева, М . Б . Шорова ; Министерств о науки и
высшего образования Российской Федерации, Кабардино-
Балкарский государственный университет им. Х.М. Бербе-
кова. – Нальчик : Каб.-Балк. ун-т, 2024. – 126 с. – Библиогр. :
с. 125. – 50 экз. – Текст : непосредственный.

Издание содержит аутентичные тексты по информационным тех-
нологиям и информационной безопасности различной степени сложно-
сти и комплекса упражнений к ним, направленных на формирование
коммуникативной компетенции, обогащение словарного запаса по-
средством ознакомления с современными специальными текстами.

Предназначено для самостоятельной работы обучающихся 1–2 кур-
сов по направлению подготовки «Информационная безопасность».

ВВЕДЕНИЕ

Основной целью профессионального образования в настоящее время является подготовка квалифицированного специалиста соответствующего уровня и профиля, конкурентоспособного на рынке труда, компетентного, способного к эффективной работе по специальности на уровне мировых стандартов, готового к постоянному профессиональному росту, социальной и профессиональной мобильности.

Профессиональный иностранный язык – важнейшее средство профессионального межличностного и межкультурного общения, без которого невозможно развитие международных связей. Расширение и качественные изменения характера международных связей, интернационализация всех сфер общественной жизни делают иностранные языки востребованными и реально необходимыми в практической и интеллектуальной деятельности человека.

Поэтому актуальными становятся проблемы разработки профильных профессиональных учебных пособий, связанных с будущей специальностью обучающихся, потому что нецеленаправленное построение пособий делает невозможным практическое использование многих из них для изучения английской терминологии, которая обязательно должны быть соотнесена с аспектами изучаемой дисциплины.

Учебное пособие разработано в соответствии с требованиями Федерального государственного образовательного стандарта высшего профессионального образования (ФГОС ВПО) по направлению подготовки 10.03.01 «Информационная безопасность». Целью данного пособия является формирование комплекса профессиональных компетенций у будущих специалистов, основная задача которых – овладеть умениями профессионального взаимодействия, вербальной и невербальной коммуникацией, научиться адекватно вести себя в любых профессиональных ситуациях общения, овладеть терминологическим минимумом по специальности «Информационная безопасность», умением читать и понимать аутентичные тексты на английском языке, а также использовать их как средство получения необходимой информации в дальнейшей профессиональной деятельности.

Текстовый материал, используемый в качестве дидактического для целей обучения профессионально ориентированному общению на англ-

лийском языке, представляет собой аутентичный дискурс и обладает как содержательной, так и лингвистической аутентичностью, включая структурную, лексико-фразеологическую и грамматическую.

Одна из основных практических целей пособия – развитие и совершенствование навыков чтения как одного из видов речевой деятельности, а также развитие умений аннотирования и реферирования англоязычной литературы по специальности «Информационная безопасность».

Материал, содержащийся в пособии, рассчитан на аудиторную и внеаудиторную работу и разбит на 3 части.

Первая часть каждого раздела представляет собой серию заданий, нацеленных на снятие терминологических трудностей, работу с профессиональным глоссарием, развитие навыков изучающего чтения, профессиональных коммуникативных навыков на основе коммуникативных упражнений. Профессиональные аутентичные тексты, развивающие различные виды чтения, снабжены системой заданий, которые обеспечивают многократное повторение лексического (в том числе и терминологического) материала. Послетекстовые задания снимают терминологические трудности и способствуют накоплению словарного запаса, необходимого для работы над текстами по данной тематике.

Работа с пособием значительно облегчается благодаря терминологическому глоссарию с толкованием основных терминов и терминологических единиц, а также общенаучной лексики по специальности.

Во второй части представлен материал на развитие различных видов чтения: поискового, ознакомительного и просмотрового. Особый акцент делается на реферативный обзор материалов при самостоятельном чтении газет, журналов и интернет-статей, на написании аннотации или реферата на английском языке и написании эссе (сообщения).

Третья часть носит информационный и справочный характер. Она содержит основные клише для написания аннотаций на английском и русском языках и англо-русский словарь специальных терминов.

Данное пособие способствует формированию следующих общекультурных компетенций, которые необходимы бакалаврам:

- использовать иностранный язык в межличностном общении и профессиональной деятельности;

- обладать навыками выражения своих мыслей и мнения в межличностном и деловом общении на иностранном языке;
- обладать навыками извлечения необходимой информации из оригинального текста на иностранном языке по вопросам истории;
- быть способным к саморазвитию, повышению своей квалификации и мастерства;
- владеть основными языковыми клише, относящимися к различным сферам профессиональной деятельности;
- осознавать социальную значимость своей будущей профессии, обладать высокой мотивацией к выполнению профессиональной деятельности.

Предлагаемые методы работы над иноязычным материалом совершенствуют навыки работы с профессиональными текстами на иностранном языке, навыки работы с отраслевыми словарями и справочниками на иностранном языке, развивают умения и навыки межличностного и делового общения на иностранном языке в сфере профессиональной коммуникации.

UNIT 1

Living in a Digital Age

The digital age has made it easier than ever before to share information, but harder to control it.

Barack Obama

Before you read answer these questions:

1. What does it mean to live in a digital age?
2. What is your favourite digital device?
3. What do you use your smartphone for most of your time?

Vocabulary

digital ['dɪdʒɪt(ə)l] – цифровой

essential [ɪ'sen(t)ʃ(ə)l] – важнейший; необходимый; основной

access ['ækses] – доступ; иметь доступ, получить доступ

research [rɪ'sɜːtʃ] – (научное) исследование; изучение

database ['deɪtəbeɪs] – база данных

complete [kəm'pli:t] – выполнять

mode [məʊd] – метод, режим

store [stɔː] – запас, резерв; хранить

carry out – *фраз. гл.* выполнять, осуществлять; приводить в исполнение

dispense [dɪ'spens] – раздавать; распределять

enter ['entə] – входить, вводить

transfer [træn(t)s'fɜː, trɑːn-] – переносить, перемещать, переводить

We are now living in what people call *the digital age*, meaning that computers have become an essential part of our lives. Young people who have grown up with PCs and mobile phones are often called *the digital generation*. Computers help students to **perform** mathematical **operations** and improve their math skills. They are used to **access the Internet**, to **do** basic **research** and to communicate with other students around the world. Teachers use projectors and interactive whiteboards to **give presentations** and teach sciences, history or language courses. PCs are also used for administrative purposes – schools use word processors to **write** letters, and databases to **keep records** of students and teachers. A school website allows teachers to publish **exercises** for students to **complete** online. Students can also enroll for courses via the website and parents can download official reports.

Mobiles let you **make** voice **calls**, **send texts**, email people and download logos, ringtones or games. With a built-in camera you can send pictures and make video calls in **face-to-face** mode. New smartphones combine a telephone with web access, video, a games console, an MP3 player, a personal digital assistant (PDA) and a GPS navigation system, all in one.

In banks, computers **store information** about the money held by each customer and enable staff to **access** large **databases** and to **carry out** financial **transactions** at high speed. They also control the cashpoints, or ATMs (automatic teller machines), which **dispense money** to customers by the use of a PIN-protected card. People use a Chip and PIN card to pay for goods and services. Instead of using a signature to verify payments, customers are asked to **enter a** four-digit **personal identification number (PIN)**, the same number is used at cashpoints; this system makes transactions more secure. With online banking, clients can easily **pay bills** and **transfer money** from the comfort of their homes.

Airline pilots use computers to help them control the plane. For example, monitors **display data** about fuel consumption and weather conditions. In airport control towers, computers are used to manage radar system and regulate air traffic. On the ground, airlines are connected to travel agencies by computer. Travel agents use computers to find out about the availability of flights, prices, times, stopovers and many other details.

I. ELICITING THE VOCABULARY

1. Match the words in bold in the text with their meanings:

1. move from one place to another _____
2. keep or accumulate something for future use _____
3. absolutely necessary; extremely important _____
4. the systematic investigation into and study of materials and sources in order to establish facts and reach new conclusions _____
5. to type information into a computer or other device _____
6. finish making or doing _____
7. a structured set of data held in a computer, especially one that is accessible in various ways _____
8. to have the opportunity or right to see or use _____
9. involving or relating to the use of computer technology _____
10. an option allowing a change in the method of operation of a device _____
11. distribute or provide a service or information to a number of people _____
12. fulfil, do _____

2. Match the synonyms.

store	numerical
enter	manner
essential	move
mode	distribute
transfer	important
dispense	keep
digital	insert

3. Find the English equivalents for the following words and word combinations in the text:

Цифровое поколение, выполнять (3), проводить исследование, интерактивная доска, текстовый редактор, вести учет, записываться на курсы, отправлять электронную почту людям, встроенная камера, выполнять финансовые операции, вводить четырехзначный пин-код.

4. Find the following words in the text and decide whether they are nouns, verbs, adjectives or adverbs. Write *n*, *v*, *adj* or *adv* next to each word.

perform_____	digital_____
word processor_____	store_____
online_____	financial_____
download_____	monitor_____
built-in_____	data_____

5. Match the words above with the correct meaning:

- | | |
|-------------------|--|
| 1. perform | a) keep, save |
| 2. word processor | b) execute, do |
| 3. online | c) monetary |
| 4. download | d) screen |
| 5. built-in | e) integrated |
| 6. digital | f) connected to the internet |
| 7. store | g) connection of facts or figures |
| 8. financial | h) describes information that is recorded or broadcast using computers |
| 9. monitor | i) program used for text manipulation |
| 10. data | j) copy files from a server to your PC or mobile |

6. Match the verbs with the nouns to make collocations from the text:

give	operations
access	research
do	the Internet
store	presentations
carry out	transactions
make	calls
perform	information

7. Use the collocations you've got to complete these sentences and translate them into Russian:

1. Thanks to Wi-Fi, it's now easy to _____ from cafes, hotels, parks and many other public places.
2. Online banking lets you _____ between your accounts easily and securely.
3. *Skype* is a technology that enables users to _____ over the Internet for free.
4. In many universities, students are encouraged to _____ using Power Point in order to make their tasks more visually attractive.
5. The Web has revolutionized the way people _____ - with sites such as *Google* and *Wikipedia*, you can find the information you need in seconds.
6. Cookies allow a website to _____ on a user's machine later retrieve it; when you visit the website again, it remembers your preferences.
7. With the latest mobile phones, you can _____ with multimedia attachments – picture, audio, even video.

USE

Discuss the following questions. Use complete sentences.

1. What *digital* devices do you have at home? Which are your favourite ones?
2. When do you turn on silent *mode* on your smartphone?
3. Do you have clothes you don't wear? If so, why do you *store* them?
4. How many digits do you *enter* to unlock your phone? How do you feel about that?
5. Do you *dispense* charity to the needy in the street? Why or why not?

II. DEVELOPING VOCABULARY

1. Match the following emoticons with the feelings and emotions they express.

	SURPRISE
	LAUGHTER
	SADNESS
	FEAR
	HAPPINESS
	LOVE
	ANGER

2. Practice the words in the following sentences and translate them into Russian.

ANGER	LOVE	HAPPINESS	FEAR	SADNESS
SURPRISE	LAUGHTER			

1. Humor and ... are best medicines for your health.
2. Our present was a great ... for her.
3. Father was strongly displeased with me and looked at me with
4. There is no greater feeling than ... between a mother and a child.
5. He showed no ... in the face of danger.
6. It was a great ... that we heard that our favourite singer had died.
7. Getting excellent marks in all the exams was the greatest

II. GRAMMAR IN CONTEXT

1. Choose the correct form of the verb *to be* in the Present, Past or Future Simple

1. The new software _____ released next month.
a) will be b) is c) was
2. If the server crashes, all the data _____ lost.
a) is b) will be c) was
3. The IT team _____ working on a new project.
a) is b) was c) will be
4. If the system _____ down, we need to reboot it.
a) is b) was c) will be
5. The programmers _____ coding a new feature for the app.
a) are b) were c) will be
6. If the network _____ slow, we should check for any issues.
a) is b) was c) will be
7. The software update _____ available for download tomorrow.
a) will be b) is c) was
8. If the website _____ down, we need to investigate the issue.
a) is b) was c) will be
9. The IT department _____ responsible for maintaining the company's network.
a) is b) was c) will be
10. If the database _____ corrupted, we may lose important data.
a) is b) was c) will be

2. Use *there is/are, there was/were* to complete the sentences.

1. _____ many programming languages commonly used in the IT industry.
2. _____ a bug in the latest software update.
3. When I started my first job, _____ a shortage of skilled developers in the company.
4. In the server room, _____ several racks of equipment.
5. In the IT department, _____ a high demand for cybersecurity experts.
6. Last week, _____ an unexpected power outage that caused a temporary network failure.
7. _____ a new version of the software available for download on the website.
8. In the office, _____ several developers working on the coding project.

9. Last week, _____ a network outage that affected the entire system.
10. On the server, _____ multiple databases storing customer information.
11. During the meeting, _____ a discussion about cybersecurity issues.
12. In the testing phase, _____ some bugs that need to be fixed.

3. Read the text choosing the right option from the words in brackets.

Technology and the Young

Modern technology (*is changing, change, changes*) all the time. Every time, scientists (*inventing, invent, invents*) new gadgets and equipment to help us with our daily and discover ways to make existing technology faster and better. Our homes (*is, be, are*) full of hardware and software.

Research (*suggests, suggest, is suggesting*) however, that it (*are, is, was*) young people who (*are, is, was*) best to deal best with this change. Whereas teenagers (*has, had, have*) no problem operating digital equipment, their mums and dads and grandparents often (finding, finds, find) using new technology difficult. But if you (*is, are, were*) a teenager who criticizes your parents for their lack of technological awareness, don't be too hard on them! Some time in the future, when you (*has, are having, have*) children of your own, your ability to deal with technology will probably decrease and your children will feel more comfortable with new technology than you (*does, are, do*). You won't want them to criticize you, will you?

IV. COMPREHENSION

1. Decide whether the following sentences are TRUE or FALSE. Correct the false ones.

1. Young people who have grown up with PCs and mobile phones are often called the virtual generation.
2. Teachers use projectors and interactive whiteboards to give presentations.
3. Mobiles let you make voice calls, send texts and email people.
4. With a built-in camera you can send pictures and make video calls in face-to-face mode.
5. In banks, computers store information about the money held by each customer.
6. Instead of using a signature to verify payments, customers are asked to enter a five-digit personal identification number (PIN).
7. Airline pilots cannot use computers to help them control the plane.
8. Travel agents use computers to find out a lot of details.

2. Answer the questions to the text:

1. What is a digital generation?
2. How do computers help teachers?
3. How do computers help schools?
4. What do we do with mobile phones?
5. What is the meaning of built-in?
a) *outside* b) *at a side* c) *upside down* d) *integrated* e) *all of these*
6. What are the long forms of PDA, ATM and PIN.
7. How do you think a smart phone is better than a normal mobile phone?
8. In banks, what do we use instead of signatures?
9. How do pilots use computers?
10. How do airport control towers use computers?
11. How do airlines connect to travel agencies?

V. DISCUSSION

Comment on the following:

If someone told you: “As digital devices cause addiction, it is safer not to use them,” what would you say?

VI. WRITING

Write a composition on the topic:

The Future of Education – Printed Books or Computers?

UNIT 2

Virtual World

*The virtual world is a canvas where we can paint
our dreams and bring them to life.*
Chris Milk

Before you read answer these questions:

1. What is a virtual world?
2. How do people interact with each other in a virtual world?
3. Can you give an example of a popular virtual world?

Vocabulary

virtual ['vɜːʃuəl, -tju-] – виртуальный

multiplayer ['mʌltɪˌpleɪə] – многопользовательский режим, многопользовательская игра

simulated ['sɪmjəleɪtɪd] – поддельный, фальшивый

avatar [ˌævə'tɑː] – аватар

three-dimensional [ˌθriːdi'men(t)ʃ(ə)n(ə)l] – трёхмерный

telepresence ['teləˌprezəns] – телеприсутствие

science fiction ['saɪəns 'fɪkʃ(ə)n] – научная фантастика

setting ['setɪŋ] – окружающая обстановка, художественное оформление

substantially [səb'stæn(t)ʃ(ə)lɪ] – существенно, в значительной степени

immediacy [ɪ'miːdiəsi] – непосредственность, прямота, открытость

emoticon [ɪ'məʊtɪˌkɒn] – эмотикон, смайлик

facial ['feɪʃ(ə)l] **expression** – мимика, выражение лица

A *virtual world* or *massively multiplayer online world* (MMOW) is a **computer-based simulated environment**. The term is synonymous with interactive 3D virtual environments, where the users take the form of **avatars** visible to others. These avatars can be textual, two or **three-dimensional** graphical representations, or live video avatars with auditory and touch sensations. In general, virtual worlds allow for multiple users.

The user accesses a **computer-simulated** world which presents perceptual stimuli to the user, who in turn can manipulate elements of the modeled world and thus experience a degree of **telepresence**. Such modeled worlds and their rules may draw from reality to fantasy worlds. Communication between users can range from text, graphical icons, visual gesture, sound, and rarely, forms using touch, and voice command.

Massively multiplayer online games depict a wide range of worlds, including those based on *science fiction*, the real world, super heroes, sports, horror, and historical *settings*. The most common form of such games are fantasy worlds, whereas those based on the real world are relatively rare. Most online games have *real-time* actions and communication. Players create a character who travels between buildings, towns, and worlds to carry out business or leisure activities. Communication is usually textual, but real-time *voice communication* is also possible. The form of communication used can *substantially* affect the experience of players in the game.

Virtual worlds are not limited to games but, depending on the degree of *immediacy* presented, can encompass computer conferencing and text based chatrooms. Sometimes, *emoticons* or 'smilies' are available to show feeling or *facial expression*. Emoticons often have a keyboard shortcut.

I. ELICITING THE VOCABULARY

1. Match the words in bold in the text with their meanings:

1. a representation of a facial expression such as a smile or frown, formed by various combinations of keyboard characters and used in electronic communications to convey the writer's feelings or intended tone _____

2. a sensation of being elsewhere, created by virtual reality technology _____

3. having or appearing to have length, breadth and width _____

4. an icon or figure representing a particular person in computer games, Internet forums, etc. _____

5. a sensation of being elsewhere, created by virtual reality technology _____

6. fiction based on imagined future scientific or technological advances and major social or environmental changes, frequently portraying space or time travel and life on other planets _____

7. the place or type of surroundings where something is positioned or where an event takes place _____

8. for the most part; essentially _____

2. Find the English equivalents in the text for the following Russian words and word combinations:

Смоделированные на компьютере условия, многопользовательский онлайн мир, трехмерный, дистанционное присутствие (телеприсутствие), пиктограмма, научная фантастика, голосовая связь, оперативность, смайлик, выражение лица.

3. Match the synonyms:

virtual world	imagination
environment	hero
fantasy	free time
emoticons	let
character	setting
leisure	modeled world
allow	'smiles'

USE

Discuss the following questions. Use complete sentences.

1. Do you have an *avatar*?
2. Do you like using *emoticons* when texting?
3. How much time do you spend *online* a day on average?

II. COMPREHENSION

1. Decide whether the following sentences are TRUE or FALSE:

1. In virtual environments the users take the form of avatars visible to others.
2. Avatars can be only textual.
3. Modeled worlds and their rules may draw from reality to fantasy worlds.
4. Communication between users can occur in different ways.
5. Massively multiplayer online games depict a wide range of worlds based only on science fiction.
6. Most online games have real-time actions and communication.
7. Virtual worlds are not limited to games but can encompass computer conferencing and text based chatrooms.

2. Answer the questions to the text:

1. How can you define virtual world?
2. What is an avatar? What kinds of avatars can you name?
3. What forms of communication in the virtual world do you know?
4. What are online games usually based on?
5. What do characters in online games do?
6. What do we use emoticons or 'smiles' for?

III. GRAMMAR IN CONTEXT

1. Read the text choosing the right option of the words in brackets.

The Search for an Internet Beauty Queen

(*There is, There are, There were*) a new beauty contest for women – "virtual" women. *Miss Digital World* (*were, is, are*) the first beauty contest for video-game heroines such as Lara Croft. The contest is really for digital artists, advertising agencies, and video game programmers. They (*sending, sends, send*) the computer design of their perfect woman to (*an, a, -*) Internet site.

The organizers (*want, wants, wanting*) people to be serious about the contest. Each contestant must (*to send, send, sends*) in the following items and information:

- five photos
- date of birth, name, address, etc.
- hair color
- eye color
- height and other vital statistics
- video

And just like Miss America and Miss Universe, Miss Digital World must be a role model. Designers must make their "contestants" walk along a virtual catwalk. The digital (*woman, women, womans*) who receives the most votes from Internet users will win. There will be a virtual presenter and virtual guests at the presentation. The organizers (*hope, hopes, hoping*) the digital queen will be used in video games, advertisements, and films such as the *Matrix*.

2. Answer the following questions:

1. How is *Miss Digital World* similar to or different from a normal beauty contest?
2. What is strange about some of the information that *Miss Digital World* contestants have to send in?
3. Would you like to create your own Beauty to take part in such competition?

3. Complete the sentences using Present Simple or Present Continuous:

1. Our team _____ (develop) a new software application for the client.

2. He usually _____ (work) as a database administrator for a large company.
3. They _____ (test) the website functionality at the moment.
4. I often _____ (read) technical articles to stay updated in the field.
5. The servers _____ (run) smoothly without any issues.
6. She _____ (attend) a cybersecurity conference this week.
7. We currently _____ (implement) a new network infrastructure.
8. He rarely _____ (use) outdated programming languages.
9. The company _____ (invest) in artificial intelligence research and development.
10. Our team members _____ (participate) in various hackathons to showcase their skills.

4. Answer the questions paying attention to the Tenses.

1. What programming languages do developers usually choose from?
2. What programming languages are currently being used by developers?
3. When is the new software update going to be released?
4. How often do bugs occur in software programs?
5. Is there a high demand for cybersecurity professionals in the industry?
6. How are you currently addressing the errors in the database?
7. What updates are you currently working on for the software?
8. How many errors were there in the database that needed to be fixed?
9. Why is the program crashing? Are you currently working on fixing the bug?
10. Are you currently hiring more cybersecurity professionals due to the high demand?

5. Put General and Alternative questions to the sentences.

1. I fixed the bug in the software last night.
2. Our team has completed the project within the given deadline.
3. She has implemented a new algorithm for data analysis.
4. The server crashed yesterday, but we managed to restore it.
5. He developed a new mobile application for iOS users.
6. We have upgraded the network infrastructure to improve connectivity.
7. They have successfully completed several cybersecurity audits.
8. The software engineer tested the new feature and found no issues.

IV. DISCUSSION

Discuss the answers to these questions with your classmates.

1. Do you think spending too much time in a virtual world can have negative effects on a person's mental health? Why or why not?
2. Are there any benefits to using virtual worlds for education or training purposes?
3. Do you think virtual reality will eventually replace traditional forms of entertainment, such as movies and TV shows?

V. WRITING

1. Read some of the opinions by random people on the topic of virtual world.

Anna: "I think virtual worlds are amazing. I've always wanted to explore new places and meet people from different countries. When I tried a virtual world, I made friends with a girl from Japan and we talked about our favorite foods. It was so cool!"

Jack: "I don't like virtual worlds. They're too fake and not real at all. I prefer to go outside and do things in the real world. Last summer, I went camping with my family and we caught fish for dinner. It was such a fun and real experience."

Sophie: "I'm not sure how I feel about virtual worlds. On one hand, it seems fun to create your own character and go on adventures. But on the other hand, I'm not sure if it's safe to talk to strangers online. My friends told me they met some strange people in a virtual world."

Mike: "Virtual worlds are the best thing ever! I love playing games and going on quests with my friends. We have a blast exploring new lands and fighting dragons together. It's like a whole other world that you can escape to whenever you want."

2. Sum up your own ideas in writing and share them with the rest of the class.

UNIT 3

Computer crime

Hacking is not a crime. It's a skill.
Johnny Long

Before you read discuss the following questions.

1. Do you agree with the statement that it is impossible to imagine the modern society without computers? Prove your point of view.
2. Give examples of computer applications.
3. How many hours a day do you spend using the computer? What do you use it for?
4. Name examples of a computer crime that you know of.

Vocabulary

hacking ['hækiŋ] – хакерство

expertise [ˌɛkspɜː'tiːz, -spə-] – знание дела; квалификация, компетентность, компетенция

unauthorized [ʌn'ɔːθ(ə)raɪzd] – запрещённый, несанкционированный

access ['ækses] – доступ

data ['deɪtə] – данные, сведения, информация

industrial espionage [ɪn'dʌstriəl 'espɪənəːʒ] – производственный шпионаж

criminal ['krɪmɪn(ə)l] – преступный, преступник

log on – входить (*в систему*)

fraudulent ['frɔːdjələnt, -dʒə, -dʒu-, -dʒu-] – обманный; жульнический, мошеннически

fraud [frɔːd] – обман; мошенничество, жульничество; подделка

swindle ['swɪndl] – обманывать, надувать

security [sɪ'kjuərəti] – безопасность

safeguards ['seɪfgɑːdz] – меры безопасности

fraudster ['frɔːdstə] – жулик, мошенник

crooked ['kruːkɪd] – добытый нечестным путем

computer virus ['vaɪ(ə)rəs] – компьютерный вирус

bug [bʌg] – ошибка, вирус

delete [dɪ'li:t] – удалять, стирать

corrupt [kə'rʌpt] – испорченный, портить

1. Read the text and underline the main idea.

Computers have become so necessary to modern living that it is difficult to believe that they are a relatively recent invention. Undoubtedly, they have proved to be of great value, but they also have their disadvantages. For one thing, they have added to our already large number of crimes.

Hacking was the first computer crime that most of us became aware of. By using their computer **expertise**, people known as hackers can gain **unauthorized access** to someone else's computer and make use of the **data** which they find there. They may, for example, get hold of lists of the names of their competitors' clients and use these to build up their own businesses, or they may use hacking as a form of **industrial espionage** to find out a rival company's plans. Other hacking activities may be more obviously **criminal**, in that hackers may **log on** to financial data in someone else's computer and either alter it illegally or use it for **fraudulent** purposes.

The possibility of serious financial **fraud** has been greatly increased by the modern practice of purchasing goods through the Internet. Apparently, the use of the **credit cards** to pay for such purchases has led to record levels of fraud with a great many people being **swindled** out of great deal of money. Banks are working hard to improve online **security** and to provide **safeguards** for customers, but **fraudsters** are working just as hard to improve their **crooked** techniques.

Many computer users worry in case their systems are affected by **computer viruses**. The people who introduce such **bugs** into other people's computer **programs** may not intentionally be committing a crime, but may be doing so as an act of mischief or spite. The motive does not really matter to the people whose data has been **deleted** or altered or whose **files** have been **corrupted**.

Computers are part of highly technical method of working, in which there are constantly new developments. Unfortunately, there is also a constant stream of new developments in the fraud industry associated with them. All computers must be on their guard.

I. ELICITING THE VOCABULARY

1. Match the words and expressions below with their definitions:

1. access	a) a small plastic card which can be used to purchase goods and services
2. bug	b) to remove something from something that has been printed or written, or from a computer file or disk
3. computer virus	c) a collection of information stored in a computer as one unit under a particular name
4. corrupt	d) the right, ability or opportunity to use something
5. credit card	e) the crime of obtaining money or goods by deliberately deceiving someone
6. delete	f) the act of getting into another person's computer without permission in order to find out or change the information stored there
7. file	g) a short computer program, usually one hidden within another program, that makes copies of itself and spreads these to other computers by means of networks or disks, causing damage or faults in the receiving computer and destroying data
8. fraud	h) to cheat or to deceive someone in order to get money
9. hacking	i) the stealing of secret information from a rival company
10. industrial espionage	j) a fault in a computer
11. swindle	k) to cause errors to appear in a computer file, making the data no longer reliable

II. GRAMMAR IN CONTEXT

1. Make the sentences complete using Past Simple or Past Continuous.

1. While I (to code), my colleague (to interrupt) me and asked me a question. I (to answer) his question and continued coding.

2. Yesterday, my friend (to install) a new software on my computer. While he (to install) the software, I (to read) the manual to understand its features.

3. Last week, we (to have) a meeting with the client to discuss their requirements. During the meeting, our team (to present) the prototype of the software.

4. When I (to check) the code, I (to realize) that there was an error in it. While I (to debug) the code, my colleague (to suggest) a solution to fix the error.

5. I (to work) on a project when my computer (to crash). After restarting my computer, I (to restore) the backup and (to continue) working on the project.

2. Make the questions complete using *Past Simple* or *Past Continuous* and answer them.

1. Which/programming language/you/use/for the previous project?

2. You/work/on fixing the bug/when/the program/crash/yesterday?

3. How/you/address/the errors/in the database/while/work/on other tasks?

4. You/find and fix/all the bugs/in the software program/last week?

5. How many errors/you/identify/in the database/during the last audit?

6. What updates/you/implement/when/the software/crash/last month?

7. You/actively/recruit/more cybersecurity professionals/due to the high demand/last quarter?

8. What programming languages/you/use/during the development phase of the project?

3. Put questions to the words in *italic*. Which of the questions you've got are the questions *to the subject*.

1. *My aunt* received a fraudulent email asking for her personal information.

2. *End-to-end encryption* is a way of securing your messages from being read by anyone except the intended recipient.

3. *By using a strong password*, you can avoid the *risk of identity theft and cyber attacks*.

4. My mom *prefers to call me* instead of using messaging apps to communicate.

5. One can *attach files* like pictures and documents to emails using email services.

III. COMPREHENSION

1. Chose the most suitable answer from the three possible answers provided and translate the sentences:

1. The first computer crime that most of us became aware of was
 - a. industrial espionage
 - b. hacking
 - c. financial fraud
2. People who gain unauthorized access to someone else's computer are called
 - a. hackers.
 - b. experts.
 - c. spies.
3. The increase of fraud through the computer is partly due to
 - a. crooked techniques.
 - b. modern practices.
 - c. internet purchases.
4. Computer files can be damaged by mischief makers using
 - a. corrupted files.
 - b. computer programs.
 - c. computer viruses.
5. According to the text, all computer users must
 - a. be up-to-date.
 - b. be careful.
 - c. be informed.

2. Find English equivalents for the following expressions in the text:

Современный образ жизни, относительно недавнее изобретение, онлайн-безопасность, иметь большую ценность, несанкционированный доступ, клиенты конкурента, создать свой собственный бизнес, производственный шпионаж, мошеннические цели, финансовое мошенничество.

3. Match the words in Column A with their meanings in Column B.

Column A

1. value
2. expertise
3. criminal
4. fraudulent
5. swindled

Column B

- a. cheated
- b. worth
- c. skill and knowledge
- d. methods
- e. unlawful

6. safeguards
7. techniques
8. corrupted

- f. made unreliable
- g. wrongful
- h. protective measures

4. Match the words in Column A with their opposite meanings in Column B.

Column A

1. unauthorized
2. find
3. build up
4. purchasing
5. online
6. crooked
7. deleted
8. constant

Column B

- a. offline
- b. permitted
- c. selling
- d. intermittent
- e. restored
- f. lose
- g. break down
- h. honest

5. Say whether the following sentences are true or false:

1. Computers have proved to be useless.
2. Hacking was the first computer crime that most of us became aware of.
3. Hackers can get unauthorized access to someone else's computer and make use of the data they find there.
4. Hacking activities are not considered to be criminal.
5. The possibility of serious financial fraud has been greatly decreased by the modern practice of purchasing goods through the Internet.
6. Banks do nothing to improve online security and to provide safeguards for customers.
7. Many computer users worry in case their systems are affected by computer viruses.

6. Answer the following questions in full sentences.

1. What are the advantages and the disadvantage of computers?
2. Name one kind of data that computer hackers can get?
3. What do banks do to improve online security?
4. If you have a computer, what precaution can you take against computer hackers?
5. What advice would you give someone who is making an online purchase with his credit card?
6. Have you ever dealt with hacking?

7. Read the text filling the gaps with the words from the box:

COMPUTER VIRUSES

<i>computers</i>	<i>virus control</i>	<i>computer virus</i>	<i>communication systems</i>
<i>replication</i>	<i>data</i>	<i>computer program,</i>	<i>risks copy</i>

A (1) ... is an unwanted program that has entered your system without your knowing about it. One of the features of a computer virus that separates it from another kind of (2) ... is that it replicates itself, so that it can spread (through flop networks) to other (3)

Using mathematical and epidemiological models of virus (4) ..., scientists concluded that the number of PCs infected is doubling every two months.

While all magazine publishing houses and the might of the world's software companies are putting huge resources behind (5) ... and prevention, it appears that viruses are here to stay.

So to keep (6) ... to a minimum it's a good idea to: regularly backup your (7) ...; make sure you always start your computer from the hard disk or write protected (8) ... of your operation system; ensure that the programs downloaded from (9) ... are saved onto flash cards so you can check them for viruses before running time; use virus detection software on any software you receive.

8. Answer the questions to the text:

1. What is a computer virus?
2. What is the difference of a computer virus from another program?
3. What did scientists say about infected PCs?
4. Can world's software companies prevent the appearance of computer viruses?
5. What are the rules you should observe to keep your computer free from viruses?

IV. WRITING

Comment on the following:

Punishment for computer crimes should be more severe than traditional crimes.

UNIT 4

Ransomware: How it Works

Ransomware is a criminal business model that can be very profitable and relatively low risk.

John McAfee

Before you read answer these questions:

1. What is ransomware and how does it work?
2. How can you tell if your computer has been infected with ransomware?
3. Who are the typical targets of ransomware attacks?

Vocabulary

extortion [ɪk'stɔːʃ(ə)n, ek-] – вымогание, вымогательство

ransomware ['ræn(t)s(ə)m weə] – программа-вымогатель

malware ['mælwɛə] – вредоносное ПО

threat [θret] – опасность, угроза

encrypt [ɛn'kript] – кодировать

release [rɪ'liːs] – избавлять, освобождать

warning ['wɔːnɪŋ] – предупреждение; предостережение

victim ['vɪktɪm] – жертва

hijack ['haɪdʒæk] – нападать с целью грабежа

prevalent ['prev(ə)lənt] – распространённый, общепринятый

disorder [dɪ'sɔːdə] – беспорядок, нарушение

The first instance of an **extortion** attack is credited to Joseph Popp back in 1989. Since then the frequency, delivery and scale of **ransomware** attacks has increased significantly; so what is ransomware and how does it work?

Ransomware is a particularly nasty form of **malware** and digital **threat**. There is usually some kind of ransomware headlining in the news around the world and those who are the victims are often at a loss as to what to do next.

Essentially, ransomware will infect an individual computer and one of two things can happen: first, it locks the computer, stopping all access to it from the keyboard, then it starts to search for data and **encrypt** the contents of the hard drive. Lastly it infects the boot sector of the computer and displays a message detailing the type of ransomware and how the individual

will pay for the **release** of the data; the message can even have fake FBI **warnings** included with it. Alternatively, and the second thing that may happen once a system is infected, the ransomware will lay in wait until a set time and date, then do all of the above and lock the computer. Waiting for a set time will ensure that numerous machines are infected before any fix can be discovered; also if all the infected machines are activated at the same time then there's more of a chance of the attacker getting their ransom paid.

You normally have a set time in which to pay the ransom, usually 72-hours. If the **victim** doesn't pay in time, the attacker can introduce a second phase into the ransomware code that will either increase the amount demanded or completely destroy the files that are being held at ransom.

Ransomware can be spread in a number of ways. The more popular choice of delivery is via an infected web page, some form of Flash script that has been **hijacked** and now contains a link to a remote server where the browser will unwittingly download the ransomware code. More recently there are instances of Drive-by attacks, where the ransomware code locates any USB sticks a user may have in their system and transfer itself in the knowledge that the stick will be inserted into a work's computer.

The WannaCry ransomware attack earlier in the year was by far one of the most **prevalent** in recent years. It's estimated that more than 250,000 computers across 200 countries were infected, rendering the likes of big companies such as FedEx, Nissan Motor Co and Telefonica SA under siege from its demands. The National Health Service in the UK was hit too, resulting in weeks of chaos and **disorder** for the staff and patients alike.

I. ELICITING THE VOCABULARY

1. Here are some words from the text. Separate them into nouns, verbs and adjectives and fill in the table.

Infected, significantly, disorder, download, ransom, nasty, popular, transfer, numerous, destroy, remote, server, victim, attack, access, data, particularly, unwillingly, usually.

nouns	verbs	adjectives	adverbs

2. Match the words in bold in the text with their meanings:

1. a person harmed, injured, or killed as a result of a crime _____
2. a state of being untidy, badly prepared, or badly organized _____
3. illegally seize (an aircraft, ship, or vehicle) while in transit and force it to go to a different destination or use it for one's own purposes _____
4. widespread in a particular area or at a particular time _____
5. malicious software, such as a virus, which is specifically designed to disrupt or damage a computer system _____
6. a type of malware from cryptovirology that threatens to publish the victim's personal data or perpetually block access to it unless a ransom is paid _____
7. the practice of obtaining something, especially money, through force or threats _____.
8. the possibility of trouble, danger, or ruin _____
9. something which is said or written to tell people of a possible danger, problem, or other unpleasant thing that might happen _____
10. convert (information or data) into a code, especially to prevent unauthorized access _____
11. allow or enable to escape from confinement; set free _____

3. Match the synonyms.

release	danger
encrypt	widespread
threat	free
prevalent	mess
disorder	caution
warning	encode

4. Find the English equivalents for the following words and word combinations in the text:

Вымогательство, неприятная форма, цифровая угроза, освещаемая в новостях, часто бывают в недоумении, содержимое жесткого диска, загрузочный сектор компьютера, заплатить выкуп, уничтожить файлы, через зараженную веб-страницу, удаленный сервер, нечаянно загрузить код вымогателя.

II. COMPREHENSION

1. Choose the letter of the correct answer.

1. Since then the frequency, delivery and scale of ransomware attacks has _____ significantly.
 - a. increased
 - b. decreased
 - c. reduce
2. Ransomware is a particularly nasty form of _____ and digital threat.
 - a. hardware
 - b. software
 - c. malware
3. Essentially, ransomware will infect an individual computer and _____ can happen.
 - a. one of two things
 - b. one of three things
 - c. only one thing
4. Once a system is infected, the ransomware will lay in wait until _____, then do all of the above and lock the computer.
 - a. late at night
 - b. a set time and date
 - c. a set day of the week
5. You normally have a set time in which to pay the ransom, _____.
 - a. usually 48-hours
 - b. usually 72-hours
 - c. usually 72-minutes
6. The more popular choice of delivery of ransomware is _____.
 - a. by post
 - b. via an email
 - c. via an infected web page
7. The WannaCry ransomware attack earlier in the year was by far one of the _____ in recent years.
 - a. most prevalent
 - b. most precious
 - c. most rare

2. Answer the questions to the text:

1. What is ransomware?
2. Do victims of ransomware usually know what to do?
3. What happens if ransomware infects an individual computer?
4. What happens if all the infected machines are activated at the same time?
5. How much time do you have to pay the ransom?
6. What were the first domesticated animals?
7. What characterizes the Metal Age?
8. What metals did early people use to make different objects?
9. What was the beginning of trade?

III. GRAMMAR IN CONTEXT

1. Complete the text with appropriate pronouns.

Inventions

If you invented something important, (1) _____ would want to make money out of (2) _____, right? Most of us would want to make money from (3) _____ invention. It seems only fair – we did the work, so the money should be (4) _____ too. Many inventors have had (5) _____ inventions produced, have become rich and famous and shouldn't blame (6) _____ for that.

But have (7) _____ heard of Tim Berners-Lee? (8) _____ invented the World Wide Web on the Internet, one of the most important inventions of the last fifty years. Millions of lives have been changed by (9) _____ introduction.

When Tim-Berners Lee invented the Web, he made a promise to (10) _____ – that he wouldn't make any money out of it, and that he would give (11) _____ invention to the world. He did, and now the Web belongs to all of (12) _____.

Ask (13) _____ what life would be like if the World Wide Web wasn't free. We should be grateful to Tim-Berners Lee, and thank (14) _____ for (15) _____ amazing gift to the world.

2. Ask questions to the text and let your fellow students answer them.

3. Complete the sentences using Future Simple or Present Continuous for the *Future/to be going to*

1. We (develop) _____ new software next week.
2. She (upgrade) _____ her computer tomorrow afternoon.
3. They (attend) _____ a technology conference next month.

4. I (start) _____ an online coding course next semester.
5. He (debug) _____ the program this evening.
6. Our team (launch) _____ a new app in a few weeks.
(we/meet) _____ for a brainstorming session later this week.
7. (she/work) _____ on a new project next month.
8. (he/learn) _____ a new programming language in the next few months.

4. Make the sentences negative and interrogative. Explain the using of the Tenses in the sentences.

1. We will develop a new software application next month.
2. He is going to attend an artificial intelligence conference next week.
3. They are going to launch a new website in the near future.
4. I will start learning a new programming language next year.
5. The company is going to invest in cybersecurity infrastructure next quarter.
6. She is going to join a data science team in the coming months.
7. We will upgrade our servers to handle increased traffic next week.
8. He is going to become a certified cloud architect in the following year.

VI. RETELLING

Work with a partner or together as a class. Retell the text *Ransomware* using your own words. Your partner or other students can ask questions about the story.

VII. DISCUSSION

Discuss the answers to these questions with your classmates.

1. What should you do if your computer gets infected with ransomware?
2. Are there any consequences for paying the ransom demanded by hackers?
3. How can individuals and businesses protect themselves from ransomware attacks?
4. Have you ever heard of a famous ransomware attack in the news?

VIII. WRITING

Write a short paragraph about the invention you consider the most important in the history of humankind.

Ransomware attacks are becoming more common. What do you think is the reason for this?

UNIT 5

Information security

Information security is everyone's responsibility.

Unknown

Before you read answer these questions:

1. What is information security?
2. How can we protect our personal information online?
3. What is a password and why is it important for information security?

Vocabulary

crucial ['kruːʃ(ə)l] – ключевой; критический, решающий

transmit [trænz'mɪt] – передавать, отправлять, пересылать

unauthorized [ʌn'ɔːθ(ə)raɪzd] – запрещённый, несанкционированный

scam [skæm] – афера, жульничество, мошенничество

fraudulent ['frɔːdjələnt] – обманный, жульнический, мошеннический

legitimate [lɪ'dʒɪtəmət] – законный, легальный; легитимный

victim ['vɪktɪm] – жертва

vulnerable ['vʌln(ə)rəbl] – уязвимый; ранимый

breach [briːʃ] – повреждение, нарушение

encryption [ɛn'krɪpʃn] – шифрование; кодирование; шифровка

security patch – патч для устранения ошибок защиты

In today's digital age, information security has become a **crucial** concern for individuals and organizations alike. With the vast amount of personal and sensitive information being stored and **transmitted** online, it is essential to take measures to protect it from **unauthorized** access and theft.

One of the most common ways in which information can be compromised is through phishing **scams**. These are **fraudulent** emails or messages that appear to come from **legitimate** sources, such as banks or social media platforms, but are actually designed to trick people into revealing their passwords or other confidential information. To avoid falling **victim** to these scams, it is important to always verify the authenticity of any message before responding to it or clicking on any links.

Another important aspect of information security is the use of strong passwords. Weak passwords that are easy to guess or crack can leave accounts **vulnerable** to hacking and data **breaches**. It is recommended to use complex passwords that include a combination of letters, numbers, and symbols, and to change them regularly.

Encryption is also a key tool in protecting sensitive information. This involves scrambling data so that it cannot be read by anyone who does not have the decryption key. Many messaging apps and email services now offer end-to-end encryption, which means that only the sender and recipient can read the messages.

Lastly, it is important to stay up-to-date with the latest security threats and software updates. Hackers are constantly finding new ways to exploit vulnerabilities in software and systems, so it is crucial to keep all devices and applications updated with the latest **security patches**.

In conclusion, information security is a vital concern in our digital world. By following best practices such as avoiding phishing scams, using strong passwords, encrypting sensitive data, and staying informed about the latest threats, we can help protect ourselves and our information from cyber-criminals.

I. ELICITING THE VOCABULARY

1. Match the words in bold in the text with their meanings:

1. conforming to the law or rules; genuine or valid _____
2. the process of converting information into a secret code to prevent unauthorized access or use _____
3. an act of breaking or failing to observe a law, agreement, or code of conduct; a gap or opening in a wall, barrier, or defense _____
4. a software update that fixes vulnerabilities and improves the security of a computer system or program _____
5. involving deceit or trickery, usually for financial gain _____
6. to send or convey something from one place to another, especially information or signals _____
7. a dishonest scheme or fraud designed to cheat people out of their money _____
8. not having official permission or approval _____
9. extremely important or necessary; essential _____
10. susceptible to physical or emotional harm or attack; easily influenced or affected by something _____
11. a person who has been harmed, injured, or killed as a result of a crime, accident, or other event _____

2. Match the synonyms.

- | | |
|------------|--------|
| legitimate | safety |
| crucial | vital |

encryption	rascally
victim	cheating
fraudulent	encoding
security	legal
scam	sacrifice

3. Find the English equivalents for the following words and word combinations in the text:

Ключевая проблема, конфиденциальная информация, несанкционированный доступ, мошеннические электронные письма, кочевой, чтобы не стать жертвой, проверить подлинность, легко угадать или взломать, утечка данных, ключ дешифрования, сквозное шифрование, чтобы быть в курсе, обновления программного обеспечения, киберпреступник.

USE

Discuss the following questions. Use complete sentences.

1. What is your *vulnerability*?
2. Have you ever been a *victim* of fraudsters? What happened?
3. What is the most *crucial* thing in your life?
4. Is it *legitimate* to download music or films from the internet in your country? How often do you do it?
5. How can some diseases be *transmitted* from one person to another?

II. COMPREHENSION

1. Answer the questions to the text:

1. Why has information security become a crucial concern in today's digital age?
2. What are phishing scams, and how can individuals protect themselves from them?
3. How can weak passwords leave accounts vulnerable to hacking and data breaches?
4. What is encryption, and how does it help protect sensitive information?
5. Which messaging apps and email services offer end-to-end encryption?
6. Why is it important to stay up-to-date with the latest security threats and software updates?
7. What are some best practices for protecting personal and sensitive information online?

2. Decide whether the following statements are true or false.

1. Information security is not important in today's digital age.
2. Phishing scams are designed to trick people into revealing their passwords or other confidential information.
3. It is not important to verify the authenticity of any message before responding to it or clicking on any links.
4. Weak passwords that are easy to guess or crack can leave accounts vulnerable to hacking and data breaches.
5. It is not recommended to use complex passwords that include a combination of letters, numbers, and symbols.
6. Encryption is not a key tool in protecting sensitive information.
7. End-to-end encryption means that anyone can read the messages.
8. It is not important to stay up-to-date with the latest security threats and software updates.
9. Hackers are not constantly finding new ways to exploit vulnerabilities in software and systems.
10. By following best practices, we cannot help protect ourselves and our information from cybercriminals.

III. GRAMMAR IN CONTEXT

1. Put tag questions to the sentences below.

1. Keeping track of installed programs is important for the security of your home network.
2. It is possible to take stock of what programs are installed on each system.
3. Running through a checklist of installed programs can help identify suspicious ones.
4. A program that shouldn't be there might be a popular backdoor for hackers.
5. Removing unwanted programs from your system is necessary for ensuring security.
6. Checking and disabling firewall entries is crucial after removing suspicious programs.
7. Knowing what programs are installed helps prevent unauthorized access to your network.
8. Regularly reviewing installed programs helps maintain a secure home network.

2. Complete the sentences using Present Perfect or Past Simple.

1. I (fix) _____ the bug in the code yesterday.
2. We (implement) _____ a new feature in the software.

3. She (work) _____ on this project this month.
4. They (complete) _____ the website redesign last week.
5. He (develop) _____ several mobile applications in the past year.
6. We (test) _____ the software extensively before releasing it to the public.
7. She (update) _____ the database with the latest information.
8. They (migrate) _____ the website to a new server successfully.
9. I (complete) _____ the coding for the new software yesterday.
10. The team (work) _____ on this project for three months now.
11. She (not finish) _____ debugging the program yet.
12. The company (release) _____ several updates for the app this year.
13. We (not test) _____ the new feature yet.

3. Translate the sentences into Russian using the correct form of the verb.

1. Мы завершили разработку новой функции для нашего приложения.
2. Мы завершили разработку новой функции для нашего приложения в прошлом месяце.
3. Команда уже выполнила тестирование новой системы безопасности.
4. Команда выполнила тестирование новой системы безопасности на прошлой неделе.
5. Я только что получил доступ к базе данных и начал анализировать информацию.
6. Я получил доступ к базе данных и начал анализировать информацию вчера.

IV. DEVELOPING VOCABULARY

Noun suffixes

1. Form nouns from the following adjectives using suffix *-ity* and translate the words into Russian. Consult the dictionary if necessary.

confidential	
authentic	
vulnerable	
sensitive	
secure	
vital	

2. Complete the sentences with the words from the table in ex. 1.

1. It is vital to prepare carefully for exams.
2. Some people with dermatitis are even sensitive to sunlight.
3. A feeling of security is a feeling of being safe and free from worry.
4. Anonymity and confidentiality are not the same.
5. The rich inner world and the vulnerability of introverts make them more attentive to the feelings of others.
6. An authentic Dolce&Gabbana handbag is usually leather.

V. TRANSLATION

Render the passage into English:

Мошенническая схема: Знакомый просит дать в долг

Что происходит: Знакомый пишет в соцсетях или мессенджерах, что он за границей и у него кончились деньги. Просит перевести, например, 5000 р. Обещает вернуть через несколько дней.

На самом деле: Аккаунт вашего знакомого взломали. От его лица пишет мошенник, который хочет получить деньги на свою карту. Как правило, в течение нескольких часов владелец аккаунта сам появляется в соцсети и рассказывает о взломе.

Как противостоять: Игнорировать просьбу о переводе и ничего не отвечать на сообщения. Позвонить знакомому, чтобы рассказать о случившемся и заодно проверить, всё ли у него в порядке.

VI. RETELLING

Work with a partner or together as a class. Speak about information security. Use your own words. Your partner or other students can ask questions.

VII. DISCUSSION

Discuss the answers to these questions with your classmates.

1. Cybersecurity is becoming more important as we rely more on technology. Do you agree or disagree?
2. Online scams and phishing attacks are becoming more common. What can we do to protect ourselves?
3. Some people believe that government surveillance is necessary for national security. What do you think?

VIII. WRITING

Write about a situation when you or someone you know became a victim of scammers.

UNIT 6

Social Engineering

Social engineering is the biggest security threat in the industry today.

Kevin Mitnick

BEFORE YOU READ

1. Read the quote above and say whether you agree or not with it. Prove your answer. What other security threats do you know?

2. Choose the appropriate answer.

1. What is social engineering?

- a) A new form of communication
- b) A new way of manipulating people to give up their personal information

- c) A new type of computer virus
- d) A new type of social media platform

2. What kind of information do scammers usually target?

- a) Personal identification numbers
- b) Social security numbers
- c) Passwords, bank and credit card details, or login information
- d) Phone numbers and addresses

3. How do scammers obtain online banking details?

- a) By asking for them directly
- b) By running keylogging and hacking software
- c) By sending phishing emails
- d) By using social media platforms

4. What is a common tactic used by scammers to get people to react quickly?

- a) Urgent requests for help
- b) Emails from friends who have been hacked
- c) Emails claiming to be from banks
- d) All of the above

5. What should you do if you receive an email offering you a financial reward?

- a) Respond with your personal information
- b) Ignore it
- c) Accept the offer and provide your bank details
- d) Report it to the authorities

6. *How can scammers gain remote access to your computer?*

- a) By sending phishing emails
- b) By running keylogging and hacking software
- c) By asking for your login information
- d) By sending pop-ups on websites

Vocabulary

manipulating [mə'nɪpjəleɪtɪŋ] – манипулирование

personal ['pɜːs(ə)n(ə)l] – личный

confidential [ˌkɒnfi'den(t)ʃ(ə)l] – конфиденциальный

request [rɪ'kwest] – запрос, просьба

phishing ['fɪʃɪŋ] – фишинг, вид интернет-мошенничества

guise [gaɪz] – облик, личина, образ

sub-heading [sʌb'hedɪŋ] – подзаголовок

webpage – страница в интернете

download ['daʊnləʊd] – загружать

software ['sɒftweə] – программное обеспечение

remote access [rɪ'məʊt 'ækses] – удалённый доступ

log in – зарегистрироваться

donation [dəʊ'neɪʃ(ə)n] – пожертвование

charitable ['tʃærɪtəbl] – благотворительный

You may think you're not the sort of person to be fooled by a scam but often the scammers have employed subtle ways and means in which to bait you.

With the rise of wider forms of communication, through social media and so on, comes a new wave of threats called social engineering. There are many forms of social engineering, so let's have a look at what you're up against, and how to combat it.

Social engineering is the new modern way of manipulating people to give up their personal and confidential information. It comes in many **guises** and under different **sub-headings**, such as Phishing and the like, but it's essentially all a form of social engineering. Essentially, the scammer will take your human nature and responses and turn it against you for their own gain.

The kind of information the scammer is after does vary, depending on the type of scam being used, but for the most part they're usually after your passwords, bank and credit card details, or login information in order to gain any sort of financial data.

You're probably more familiar with social engineering that you suspect, even if you're new to the term. Recall the emails from someone, usually based in Nigeria, who has come into a fortune in the billions and for some

inexplicable reason wants to put the money in your bank account. Needless to say, the money was never there in the first place and should you go through the process you will eventually be persuaded to hand over some banking information which the scammer can then use to steal from you.

There aren't too many Nigerian scams these days, mostly you get a phone call from someone claiming to be from Microsoft or some other well-known company, who insists that they are tracking a virus or other harmful malware that's currently residing on your computer. They ask you to visit a **webpage** and download a piece of software that will allow them remote access to your computer. When in, they run a script that displays a wealth of useless information on the screen whilst in the background they run keylogging and hacking software to obtain your online banking details. They can even ask you to log into your bank while connected to make sure everything is working.

Other common social engineering tactics include emails from a friend, who has been hacked, with the scammer masquerading as them. It could be an email claiming to be from your bank, an urgent request for help or someone asking for a **donation** to a charitable organisation. Be wary, and question everything.

I. ELICITING THE VOCABULARY

1. Fill in the gaps using the words from the box.

Information, employed, personal, up, bank, passwords, wave, combat, scammer, new, account, social, engineering, masquerading, threats, of, confidential

With the rise of wider forms of communication, through social media and so on, comes a ____ (1) ____ (2) ____ (3) ____ (4) called social engineering. There are many forms of social engineering, so let's have a look at what you're ____ (5) against, and how to ____ (6) it.

Social engineering is the new modern way of manipulating people to give up their ____ (7) and ____ (8) ____ (9). It comes in many guises and under different sub-headings, such as Phishing and the like, but it's essentially all a form of social engineering. Essentially, the ____ (10) will take your human nature and responses and turn it against you for their own gain.

The kind of information the scammer is after does vary, depending on the type of scam being used, but for the most part they're usually after your ____ (11), bank and credit card details, or login information in order to gain any sort of financial data.

You're probably more familiar with _____(12) _____(13) that you suspect, even if you're new to the term. Recall the emails from someone, usually based in Nigeria, who has come into a fortune in the billions and for some inexplicable reason wants to put the money in your _____(14) _____(15). You may think you're not the sort of person to be fooled by a scam but often the scammers have _____(16) subtle ways and means in which to bait you.

Other common social engineering tactics include emails from a friend, who has been hacked, with the scammer _____(17) as them.

2. Match the words with their definitions.

1. social	a) a long body of water that moves continuously in one direction, or a gesture made by moving the hand back and forth
2. passwords	b) statements or actions indicating harm or danger to someone or something
3. threats	c) a fight between two individuals or groups, often involving weapons or physical force
4. bank	d) relating to an individual's private life, feelings, and thoughts
5. employed	e) intended to be kept secret or private, not to be shared with others
6. combat	f) knowledge or facts about something or someone
7. engineering	g) a person who uses deceitful methods to cheat or defraud others for financial gain
8. masquerading	h) a sequence of characters used to access a computer system or online account
9. scammer	i) relating to human society and its organization, customs, and interactions
10. information	j) the application of scientific principles to design and build machines, structures, and systems
11. wave	k) a financial institution that accepts deposits from customers and provides loans and other financial services
12. account	l) a record of financial transactions related to a particular person or business
13. personal	m) having a job or being paid to work for someone else
14. confidential	n) pretending to be someone or something else in order to deceive others

II. COMPREHENSION

1. Read the text again and answer the questions

1. What is social engineering and how does it work?
2. What kind of information are scammers usually after in a social engineering scam?
3. How do scammers use human nature to their advantage in social engineering scams?
4. Can you give an example of a common social engineering tactic used by scammers?
5. Why do scammers often want people to react quickly to their requests?
6. What should you do if you receive an email from a friend who has been hacked, according to the text?
7. Are foreign offers for financial rewards or lottery funds usually real or fake?
8. What can you do to combat social engineering tactics?

2. Guess whether the sentences are true or false. If the sentences are false, correct them.

1. Social engineering is a new type of threat that has emerged with the rise of social media.
2. Social engineering is a form of manipulation that aims to get people to give up their personal and confidential information.
3. Scammers are only interested in financial data such as bank and credit card details.
4. Nigerian scams are still common these days.
5. Scammers often claim to be from well-known companies such as Microsoft.
6. Scammers can use keylogging and hacking software to obtain your online banking details.
7. Emails from friends asking for help are always genuine.
8. Scammers want you to react quickly and use high-pressure tactics.
9. It's important to take a moment to figure out what's going on and not fall for any high-pressure tactics.
10. Lottery funds from other countries are always genuine.

3. Read the dialogue about some kind of fraud and make up a situation of your own.

Detective Jones: Hi there, can you tell me what happened to you, Mr. Smith?

Mr. Smith: Yes, officer. I got a phone call from someone who said they were from my bank and told me that something strange was happening in my account.

Detective Jones: What did the person ask you to do?

Mr. Smith: They asked me to log in to my online banking and check some information to make sure everything was ok.

Detective Jones: Did you do it?

Mr. Smith: Unfortunately, yes. I thought it would be good to double-check.

Detective Jones: Ok. Did you notice anything weird while doing this?

Mr. Smith: Well, they were very insistent and kept telling me how important it was to act fast. Looking back, I should have been more careful.

Detective Jones: Scammers are experts at using people's trust and emotions. They know how to make you feel like you need to do something right away.

Mr. Smith: I learned that the hard way. Is there anything else I can do to protect myself?

Detective Jones: Sure! First of all, always be careful with unsolicited emails, calls or messages that ask for your personal information. Second, take the time to think before making decisions about sensitive data. Don't let anyone pressure you into doing something you're not comfortable with. Third, use strong passwords and two-factor authentication whenever possible. And lastly, keep an eye on your accounts for any suspicious activities and report them immediately.

4. Rearrange the words to make the correct sentences

1. Of / you're / to / it / are / up / and / forms / a / so / social / engineering / let's / many / combat / There / what / look / how / at / against / have

2. If / social / You're / more / term / to / that / familiar / probably / with / engineering / even / suspect / you're / you / the / new

3. They / is / to / while / everything / to / even / make / your / into / working / can / bank / you / sure / connected / ask / log

4. Quickly / you / want / as / urgency / of / scammers / Many / a / matter / react / to

5. On / Take / out / any / tactics / and / what's / don't / moment / figure / for / high / pressure / fall / a / going

6. An / hour / Ask / a / for / friend / to / half / call/

III. GRAMMAR IN CONTEXT

1. Choose the correct form of the verb (Past Perfect or Past Simple) to complete the sentences:

1) Yesterday, I _____ (had finished/finished) debugging the code before I left the office.

2) By the time they called me, I _____ already (had fixed/fixed) the issue.

3) The server _____ (had crashed/crashed) right after we installed the new software.

4) She _____ (had not found/didn't find) the solution until she contacted the support team.

5) After the update, the system _____ (had run/ran) much smoother than before.

6) They _____ (had not worked/didn't work) on the project for a week when they realized they were using the wrong framework.

7) After he _____ (had received/received) the email, he immediately started working on the task.

8) The backup process _____ (had been/was) already completed before the power outage occurred.

2. Translate the sentences paying attention to the sentences in the Past Perfect.

1. Когда я пришел на работу, команда уже закончила разработку нового продукта.

2. Мы не могли запустить тестирование, потому что клиент еще не предоставил нам доступ к их системе.

3. Пользователь сообщил о проблеме, которую мы уже исправили в прошлом обновлении программного обеспечения.

4. Проект был успешно завершен к моменту, когда новый руководитель пришел в нашу команду.

5. Компания была вынуждена закрыться, потому что они потеряли важного клиента.

IV. ADDITIONAL READING

1. Write a summary of the text given below.

2. Turn the highlighted sentences into the Past Perfect Tense.

Modern Day Security

It's tempting to think we've made up the words Phishing, Vishing and Smishing but in actual fact they're all forms of social engineering scams. Whilst we've covered social engineering already, it's worth looking at these three modern day threats individually.

Social engineering, the act of getting information from a person based on their human instinct to react, help or be entrapped into some form of false promise, isn't as modern as the name suggests. Although the term 'social engineering' is in fact relatively new, the process of obtaining sensitive information from a victim has been around for a very long time.

The digital age, of course, has increased the attacks and how they're delivered. No longer is a victim beguiled by post, now they're bombarded by false websites, emails and a string of other cleverly disguised mediums.

Let's break down the three main modern methods of how a scammer will attempt to obtain your personal and sensitive information: Phishing, Vishing and Smishing

Phishing is the attempt to obtain information from a potential victim through emails, messaging, social media and auction sites. They can come in the form of an email, for example, claiming to have some money available for you or pretending to be from your bank or credit card company. ***Social media phishing includes individuals befriending you, or pretending to be someone you may know, then asking for information.*** Similarly a phishing attack can come in the form of a Facebook seemingly friendly test, such as 'name the top five things about yourself and tag ten friends... The unwitting victim will happily reveal their date of birth, where they were born, pets names, names of any children and so on. The attackers will gather all that information and use it to their advantage.

Interestingly there are also three different phishing types: Spear, Clone and Whaling. Spear phishing is designed to specifically target an individual, gathering information such as the above Facebook 'game' whereby the scammer can personalise their attack on the victim.

Clone phishing is an attack type that uses a previously delivered, legitimate email containing an attachment but with the details changed and the attachment swapped for a virus or keylogger. To the victim the email looks real, since it's cloned from a real email, and when the attachments opened it infects the computer.

Whaling is when a phishing attack targets senior executives of a company or a high profile individual or business. The attack is a finely crafted email or web address that's created to look business-like and containing information specific to the company or individual.

V. WRITING

Choose one of these themes and write an essay.

1. Many people believe that only the elderly or less tech-savvy individuals fall for social engineering scams. Is this a fair assumption?
2. Some argue that companies should take more responsibility for protecting their customers from social engineering scams. To what extent do you agree or disagree with this statement?
3. As technology continues to advance, so do the tactics used by social engineering scammers. How can individuals and businesses stay one step ahead of these threats?

UNIT 7

The Basics of Email Communication

Email, instant messaging, and cell phones give us fabulous communication ability, but because we live and work in our own little worlds, that communication is totally disorganized.

Marilyn vos Savant

Before you read

1. Read the quote above and say whether you agree or not with it. Prove your answer.

2. Discuss the questions below.

1. Do you use the internet every day? What do you usually do on the internet?
2. Have you ever sent an email to someone in another country?
3. Do you think the internet has made communication easier or more difficult?
4. Have you ever had a negative experience online?
5. How important is the internet for your daily life?
6. Do you prefer communicating through email or social media?
7. Can you imagine living without the internet? Why or why not?

Vocabulary

email ['i:meɪl] – электронная почта, электронное письмо

inbox ['ɪnˌbɒks] – почтовый ящик

spam [spæm] – спам

attachment [ə'tætʃmənt] – приложение к электронному письму

download ['daʊnləʊd] – скачать

upload ['ʌpləʊd] – выгружать в сеть

inbox ['ɪnˌbɒks] – почтовый ящик

search engine [sɜːtʃ 'endʒɪn] – поисковая система

online shopping – покупки в Интернете

social media post – публикация в социальных сетях

to bookmark a website – добавить сайт в закладки

hit the like button – нажать кнопку "Нравится"

Read the text thoroughly and choose the appropriate title to this text.

The internet has become an essential part of our lives, and it's hard to imagine a world without it. It has revolutionized the way we communicate,

work, and access information. One of the most popular ways of communicating online is through email.

Email is an electronic message that can be sent from one computer to another using the internet. It's a quick and convenient way of communicating with friends, family, and colleagues. You can send an email at any time of the day, and the recipient will receive it instantly. Unlike traditional mail, there is no need for stamps or envelopes, and it's completely free.

To send an email, you need an email address and an internet connection. You can create an email account for free on various websites such as Gmail, Yahoo, or Outlook. Once you have created an account, you can start sending and receiving emails.

Emails are composed of three parts: the header, body, and footer. The header contains the recipient's email address, subject line, and sender's email address. The body is where you write your message, and the footer contains your signature and any other relevant information.

One of the advantages of email is that you can attach files such as documents, images, or videos. This makes it easy to share information with others. However, it's important to be careful when opening attachments from unknown sources as they may contain viruses or malware.

In conclusion, the internet and email have changed the way we communicate and access information. Email is a fast and convenient way of staying in touch with others, and it's easy to use once you understand the basics.

Choose the appropriate title to the text:

- The Basics of Email Communication
- How to Send a Letter via Email
- The Negative Impact of the Internet on Society

I. ELICITING THE VOCABULARY

1. Match the words with their definitions

1.email	a) a digital message sent and received through the internet or other computer networks
2.upload	b) a folder in an email account where incoming messages are stored
3.attachment	c) unwanted or unsolicited emails, often advertising products or services
4.spam	d) a file that is sent along with an email message
5.inbox	e) to transfer data or files from a remote computer to one's own device
6.download	f)to transfer data or files from one's own device to a remote computer

2. Fill in the missing words from the box.

Search engine, to open an attachment, online shopping, attachment, inbox, download, upload, spam, to check your inbox

1. I need to check my _____(1) for an important message from my boss.
2. There are too many new messages in my _____(2) and I don't know which one to read first.
3. Some _____(3) emails may contain viruses or scams, so be careful and don't click on them.
4. The _____(4) in the _____(5) was a photo of my friend's new baby.
5. I am going to _____(6) a new game to play on my phone.
6. I want to _____(7) some pictures from my vacation to Instagram.
7. Every day, I send an _____(8) to my best friend who lives in another country.
8. Before you log out of your _____(10) account, don't forget _____(11) for new messages.
9. It is not safe _____(12) from an unknown sender or _____(13) files from untrusted websites.
10. When you want to find information on the internet, you can use a _____(14) like Google or Bing.
11. My mother likes _____(15), she buys almost everything from Amazon.

II. COMPREHENSION

1. Read the text again and choose the right variant

1. *What has become an essential part of our lives?*
 - a) Traditional mail
 - b) The internet
 - c) Stamps
 - d) Envelopes
2. *What is email?*
 - a) A type of traditional mail
 - b) An electronic message sent using the internet
 - c) A type of social media platform
 - d) A type of instant messaging app
3. *What is one advantage of email over traditional mail?*
 - a) It's more expensive
 - b) It's slower
 - c) It requires stamps and envelopes
 - d) It's completely free

4. *What do you need to send an email?*
 - a) An email address and a phone number
 - b) An email address and an internet connection
 - c) A physical address and a phone number
 - d) A physical address and an internet connection
5. *Where can you create an email account for free?*
 - a) On various websites such as Gmail, Yahoo, or Outlook
 - b) At the post office
 - c) At the library
 - d) At the bank
6. *What are the three parts of an email?*
 - a) Header, body, and footer
 - b) Header, body, and attachment
 - c) Attachment, body, and footer
 - d) Header, attachment, and footer
7. *What is one advantage of email when it comes to sharing information?*
 - a) You can only share text
 - b) You can't attach files
 - c) You can attach files
 - d) You can only share information with people in your immediate area
8. *What should you be careful of when opening attachments from unknown sources?*
 - a) They may contain viruses or malware
 - b) They may contain important information
 - c) They may be too large to download
 - d) They may be irrelevant to the email

2. Say whether the sentences are true or false. Correct the false ones.

1. The internet has not revolutionized the way we communicate, work, and access information.
2. Email is a slow and inconvenient way of communicating with others.
3. You need an email address and a phone number to send an email.
4. You can only create an email account on Gmail.
5. The body of an email is where you write your message.
6. The footer of an email contains the recipient's email address.
7. You cannot attach files to an email.
8. It's safe to open attachments from unknown sources.
9. Email is a fast and convenient way of staying in touch with others.
10. Email is difficult to use even if you understand the basics.

3. Here are some communicative situations. Read them and make up situations of your own.

1. *Lily*: «Did you receive my email about the project?»

Tom: «Yes, I did. I haven't had a chance to read it yet though».

2. *Amy*: «I can't find the important email from my boss in my inbox».

Jack: «Did you check your spam folder? It might be there».

3. *Sophie*: «I got an email with an attachment, but I can't open it».

Mike: «You might need to download the software to open it. I can help you with that».

4. *Ben*: «I need to upload some files to send to my professor».

Emily: «You can do that through the school's online portal. It's pretty simple to use».

5. *Max*: «I'm trying to find information about a topic. Which search engine do you recommend».

Olivia: «Google is the most popular one. Just type in your keywords and hit search».

4. Read the sentences and try to guess whether they are considered as advantages or disadvantages of using the email. What else can you add to the list.

1. It helps you stay connected with people who are far away

2. Cyberbullying and online harassment can happen.

3. Some websites may be inappropriate or unsafe for children

4. You can learn new things online

5. Spending too much time online can be bad for your eyes and health

6. Email is a fast way to communicate with people

7. You can find answers to questions on the internet

8. You can get information quickly and easily

9. People can share false information online

10. Addiction to the internet is possible

III. GRAMMAR IN CONTEXT

1. Complete the following sentences according to the rules of the Sequence of Tenses:

1. By the time I ____ (arrive) at the office, the software ____ (already release).

2. After the developer ____ (fix) the bug, she ____ (test) it thoroughly.

3. I ____ (start) learning coding last year and I ____ (already master) several programming languages.

4. Once the system ____ (go) live, we ____ (monitor) it closely for any issues.

5. The project manager ____ (inform) the team that the deadline ____ (be) moved to the following week.
6. If the database ____ (crash), we ____ (lose) all the data.
7. The company ____ (hire) a new IT manager next month to oversee the IT department.
8. Our team ____ (spend) hours debugging the code before we ____ (finally find) the error.
9. By the time the server ____ (restart), all the users ____ (log) out.
10. If the network ____ (fail), we ____ (not be able to) access the internet.

2. Rewrite the sentences using the Reported Speech

1. "I will fix the bug later," the IT instructor claimed
2. "We have completed the coding for the new software," she stated.
3. "They are going to launch the website next week," the manager said.
4. "I can't attend the meeting on Friday," the IT manager refused.
5. "We are working on improving the user interface," they answered.
6. Peter persuaded, "I am currently updating the server software."
7. IT specialist claimed, "I have just finished debugging the program."
8. Tom said, "We are developing a new mobile application."
9. Anna promised, "I will send you the report by email."
10. Mark said, "We are planning to implement a new security measure."

3. Change the Reported speech into Direct

1. The IT specialist said that the software update was ready and the development team had already completed the testing phase.
2. The IT support team mentioned that they had begun troubleshooting the issue immediately when the network outage occurred.
3. The IT security team reported that they had implemented additional security measures after the cybersecurity breach was discovered.
4. The IT infrastructure team stated that they would configure the new server for optimal performance once it was installed.
5. The IT project manager informed that they had already created a detailed plan for the data migration before it started.

4. READING EXERCISES

1. Make a summary of the text

2. Rewrite the highlighted sentences using the reported Speech

Example: *Usually the caller will be led to believe that there's a virus on their computer. – The IT Specialist told me that the caller would be led to believe that there was a virus on their computer.*

Types of Social Engineering

Social engineering is a term used to describe the various ways that criminals trick people into revealing their personal information, such as passwords and credit card numbers. ***They can do this by pretending to be someone else or by creating a sense of urgency.*** Here are some common types of social engineering attacks:

1. Phishing: In a phishing attack, the criminal sends an email that appears to come from a reputable company, such as a bank or an online retailer. ***The email usually asks the recipient to click on a link and enter their personal information.*** However, the link takes them to a fake website, where the criminal collects their information.

2. Spear phishing: This is a more targeted version of phishing. The criminal researches their victim in advance and then sends them a personalized email that appears to come from someone they know, such as a coworker or a friend. The goal is still to trick the recipient into revealing their personal information.

3. Baiting: ***Baiting attacks involve offering the victim something in exchange for their personal information.*** For example, the criminal might leave a USB drive somewhere that the victim is likely to find it, such as a coffee shop. If the victim picks up the USB drive and plugs it into their computer, malware is installed that allows the criminal to access their personal information.

To protect yourself from social engineering attacks, it's important to be cautious and skeptical. ***Never give out your personal information unless you're absolutely sure who you're dealing with, and never click on links in emails or download files from unknown sources.***

3. Use one of the following topics to write an essay.

1. Email is a better way to communicate than talking on the phone. Do you agree?

2. The internet is full of information, but not all of it is true. What do you think?

3. Some people believe that social media is a waste of time. Do you agree or disagree?

4. The internet has changed the way we live our lives. Is this change positive or negative?

5. More and more people today are using the internet for shopping. Is this trend good or bad?

UNIT 8

Vishing and Smishing Scams

Vishing and smishing attacks are becoming increasingly sophisticated, and it's important for individuals to stay informed and educated about the latest threats.

Raj Samani

Before you read.

1. Read the quote above and say whether you agree or not with it. Prove your point of view.

2. Discuss the questions. Give reasons for your answers.

1. Have you ever received a phone call from someone claiming to be from a well-known computer company? What would you do if you received a call like this?

2. Have you ever received a text message asking you to confirm your personal details?

3. Why do scammers use vishing and smishing techniques instead of just sending an email?

4. What are some common tactics used by scammers in vishing and smishing attacks?

5. Can you think of any ways to protect yourself from these types of scams?

6. How important is it to stay vigilant against these types of scams in today's digital age?

Vocabulary

vishing – фишинг по телефону

voice phishing – фишинг, угроза, исходящая от электронных писем

social engineering attack ['səʊʃ(ə)l ,endʒɪ'nɪərɪŋ ə'tæk] – атака социальной инженерии

vulnerability [ˌvʌln(ə)rə'bɪləti] – уязвимость

victim ['vɪktɪm] – жертва

remote connection – удаленное подключение

script [skript] – скрипт

confuse [kən'fjuːz] – сбивать с толку, смущать

baffle ['bæfl] – дефлектор, сбивать с толку

keylogger – кейлоггер, клавиатурный шпион

username and password – имя пользователя и пароль

steal [sti:l] – воровать

scam [skæm] – афера

fraud [frɔ:d] – мошенничество

legitimate [li'dʒɪtəmət] – законный

confirmation [ˌkɒnfə'meɪʃ(ə)n] – подтверждение

link – ссылка

keystroke [ki:stroʊk] – нажатие клавиш

delivery [drɪ'liv(ə)rɪ] – доставка

baiting techniques – приемы травли

remain vigilant [rɪ'mein 'vɪdʒɪlənt] – сохранять бдительность

be savvy ['sævi] – быть сообразительным

3. Read the text thoroughly and find the appropriate title to it.

Vishing is voice phishing, using a telephone call to commit some form of social engineering attack. The victim will, as we've explained previously, receive a call from a legitimate sounding call centre with the person on the line claiming to be from a well-known computer related company. Usually the caller will be led to believe that there's a virus on their computer or that some form of security vulnerability has been detected. The victim will then be guided to a website where the caller can make a remote connection to their computer. Once on the victim's computer, the caller will then run a script that will display reams of data on the screen designed to confuse and baffle the victim, in the meantime, they're secretly running a keylogger in the background.

In some circumstances they can then claim to have fixed the so called issue but ask you to log into your bank to double-check all is well. With a keylogger in place, they can then see your username and password on their screen; after which they log in and steal from your account

Alternatively an automated call can ask you to enter your credit card number into the phone's keypad, as it's been reported as being used elsewhere. Of course it hasn't but as soon as you enter the details they're recorded and your card can be used by the scammers,

Smishing is an SMS form of phishing In these cases you receive a text from a seemingly legitimate source, usually your bank or credit card company but also in the form of a competition winner or something free, asking you to confirm your details. There's often a link for you to follow, which leads to a false website that logs your keystrokes and records your data.

Some smishing attacks will ask you to send a return SMS to approve an action, such as a delivery of some goods. The return message is designed to cost significantly more than the usual SMS rate, with the money going straight to the scammers.

One way or another, each of these scams are designed to bait the victim, hence the phishing element, a homophone of the word fishing. The best defence is to ignore, delete or hang up on anything that's even remotely suspicious. Microsoft doesn't know if you have a virus, and nor will it telephone you. Your bank won't email you for your account details and don't be tempted to fill in any Facebook games with personal information. In short, be savvy about baiting techniques and remain vigilant.

4. Choose the appropriate title to the text:

1. Vishing and Smishing Scams: How to Recognize and Avoid Them
2. The Benefits of Keyloggers for Remote Computer Support
3. Understanding the Phonetics of Social Engineering

I. ELICITING THE VOCABULARY

1. Fill in the gaps using the words from the box.

legitimate source, voice phishing, smishing, security vulnerability, keylogger, remote connection, baiting techniques, username and password

Vishing is ____ (1), using a telephone call to commit some form of social engineering attack. Usually the caller will be led to believe that there's a virus on their computer or that some form of ____ (2) has been detected. The victim will then be guided to a website where the caller can make a ____ (3) to their computer. With a ____ (4) in place, they can then see your ____ (5) on their screen; after which they log in and steal from your account

____ (6) is an SMS form of phishing. In these cases you receive a text from a seemingly ____ (7), usually your bank or credit card company but also in the form of a competition winner or something free, asking you to confirm your details.

In short, be savvy about ____ (8) and remain vigilant.

2. Match the words and expressions with their definitions.

1) remain vigilant	a) A dishonest scheme or fraud, often involving the theft of money or personal information
2) details	b) wrongful or criminal deception intended to result in financial or personal gain
3) delivery	c) The fraudulent practice of sending emails or messages purporting to be from reputable companies in order to induce individuals to reveal personal information, such as passwords and credit card numbers
4) baiting techniques	d) Conforming to the law or rules; genuine or valid
5) phishing	e) The action of verifying or validating something, often by receiving official approval or proof
6) return sms	f) Specific pieces of information about a particular subject or situation
7) confirmation	g) A clickable connection between two web pages or documents that takes you from one to the other
8) be savvy	h) A text message sent back to the original sender in response to an initial message or request
9) legitimate	i) The process of transporting goods or items from one place to another
10) link	j) To stay alert and watchful, especially in situations where there may be potential danger or risk
11) fraud	k) To have practical knowledge and understanding of a particular subject or situation, often used in reference to technology or business practices

II. COMPREHENSION

1. Read the text again and choose the right answers to the questions.

1. *What is vishing?*

- a) A form of phishing through SMS
- b) A form of phishing through voice calls
- c) A form of phishing through email

d) A form of phishing through social media

2. *What is the purpose of a vishing call?*

a) To ask for personal information

b) To sell a product

c) To fix a computer virus

d) To commit a social engineering attack

3. *How does a vishing call work?*

a) The caller will ask for personal information

b) The caller will guide the victim to a website

c) The caller will fix a virus on the victim's computer

d) The caller will sell a product

4. *What is a keylogger?*

a) A tool to fix computer viruses

b) A tool to display data on the screen

c) A tool to record keystrokes

d) A tool to confuse and baffle the victim

5. *What is smishing?*

a) A form of phishing through voice calls

b) A form of phishing through email

c) A form of phishing through social media

d) A form of phishing through SMS

6. *How do smishing attacks work?*

a) By asking you to send a return SMS to approve an action

b) By sending you a text from a seemingly legitimate source

c) By asking you to confirm your details on a false website

d) All of the above

7. *What is the purpose of a smishing attack?*

a) To bait the victim

b) To sell a product

c) To fix a computer virus

d) To commit a social engineering attack

8. *What is the best defense against phishing attacks?*

a) Ignoring, deleting, or hanging up on anything that's remotely suspicious

b) Entering personal information into Facebook games

c) Responding to automated calls asking for credit card information

d) Logging into your bank account when asked to do so by a caller

9. *What is the meaning of the word «phishing»?*

a) A homophone of the word fishing

b) A tool to fix computer viruses

- c) A tool to display data on the screen
- d) A tool to record keystrokes

2. Discuss the situation and give your advice how to keep your personal information safe.

Detective Jones: Ma'am, can you tell me what happened?

Ms. Smith: Yes, I received a call from someone claiming to be from my bank, saying there was some suspicious activity on my account.

Detective Jones: And did they ask for any personal information or passwords?

Ms. Smith: Yes, they asked for my account number and password...and foolishly, I gave it to them.

Detective Jones: Okay. Did they do anything else during the call?

Ms. Smith: Yes, they asked me to verify some recent transactions and directed me to a website where they could remotely access my computer.

Detective Jones: And did you let them?

Ms. Smith: Unfortunately, yes. They said they were fixing the problem, but then later I found out that £1000 had been taken from my account.

Detective Jones: I see. Do you have any idea who these scammers might be?

Ms. Smith: No, not really. It sounded like an official call centre.

Detective Jones: These criminals are becoming more sophisticated by the day. Have you heard of vishing or smishing before? It sounds like one of these scams.

Ms. Smith: No, I haven't. What are those?

Detective Jones: Vishing is when scammers use voice calls to commit social engineering attacks, while smishing uses text messages to trick people into giving away their personal information.

Ms. Smith: Oh, that's terrible. How can we protect ourselves from these scams?

Detective Jones: The best defence is to ignore any unsolicited calls or messages, especially if they're asking for personal details. Don't click on links or download files from unknown sources either.

Ms. Smith: Thank you for your advice, Detective.

Detective Jones: You're welcome. We'll investigate this matter further and try to catch those responsible. In the meantime, please be extra vigilant with your bank transactions and report any suspicious activity to them immediately.

3. Read the sentence below and say whether they are true or false. Correct the false ones.

1. Vishing is a type of phishing that uses a telephone call to commit social engineering attacks.
2. The caller in a vishing attack will claim to be from a well-known computer-related company.
3. The victim will be guided to a website where the caller can make a remote connection to their computer.
4. The caller in a vishing attack will ask the victim to log into their bank account to double-check if everything is well.
5. The caller in a vishing attack will display reams of data on the victim's computer to confuse and baffle them.
6. Smishing is a form of phishing that uses email to commit social engineering attacks.

IV. GRAMMAR IN CONTEXT

1. Open the brackets using the verbs in Passive Voice (Present, Past, Future Simple)

1. The new software update ____ (install) by the IT specialists tomorrow.
2. The security system ____ (set up) by the IT specialists last week.
3. The network maintenance ____ (perform) by the IT specialists next month.
4. The new servers ____ (install) by the IT specialists yesterday.
5. The software upgrades ____ (implement) by the IT specialists this week.
6. The virus scan ____ (complete) by the IT specialists earlier today.
7. The data backup ____ (carry out) by the IT specialists regularly.
8. The troubleshooting process ____ (handle) by the IT specialists.
9. The new firewall configuration ____ (complete) by the IT specialists last night.
10. The system reboot ____ (conduct) by the IT specialists tomorrow morning.

2. Rewrite the following sentences using Passive Voice.

1. They develop a new software application.
2. The team will implement the new database system next month.
3. We tested the software for bugs and issues.
4. The company released a new security update for the network.
5. They upgrade the server hardware to improve performance.
6. The IT specialist fixed the server issue.

III. ADDITIONAL READING

1. Read the text and make a short summary.
2. Rewrite the highlighted sentences using Passive Voice.
3. Find four sentences in Passive Voice and turn them into Passive.

What is Encryption?

The definition of encryption is 'the process of converting information or data into a code, to prevent unauthorised access.

The word encryption comes from the ancient Greek word Kryptos, which means hidden or secret. Interestingly, the use of hiding messages from others can be traced back to early Egyptian scribes who inserted non-standard hieroglyphs within other communications in order to hide the message from casual viewers. ***According to historians the Spartans used strips of leather with messages engraved.*** When the strips were read they were meaningless but when wrapped around a staff of a certain diameter the characters would be decipherable.

During the early digital age the only users of encryption were the government and military, and as such between them they created a set of algorithms and standards to protect the communication on the battlefield and from one government agency to the next. These algorithms grew in complexity as technology advanced and it wasn't long before the military-based forms of encryption were being used in commercial modes of communications. Within a few short years, bank transfers, cash withdrawals and data sent to and from modems began utilising these new protocols to protect sensitive information.

Today we're regularly seeing and using devices that boast 'military grade 256-bit AES' forms of encryption, a standard that is regarded as nearly impossible to break without spending billions on specialist hardware and software. ***In plain English, the modern form of encryption takes data and passes it through an algorithm together with a key.*** This creates a garbled file of characters that can only be clearly read if the correct key is applied to decrypt the data. Algorithms today are divided into two categories: symmetric and asymmetric.

Symmetric key ciphers use the same key to both encrypt and decrypt data. The most popular symmetric cipher is AES (Advanced Encryption Standard), developed by the military and government to protect communications

and data. This is a fast form of decryption that requires the sender to exchange the key used to encrypt the data with the recipient before they're able to read it.

Asymmetric key ciphers are also known as public-key cryptography and utilise two mathematically linked keys, public and private. The public key can be shared with everyone and is usually generated by software or provided by a designated authority. The private key is something that's usually only known by the individual user. Interestingly both types of keys can be applied, where one user has a public key and another a private key, which can be combined to form a shared encryption level.

These keys are many characters in length, proving it nigh impossible for someone to Brute Force hack them. ***The Brute Force method involves using a program on a computer to try every possible combination of a key until the correct one is found.*** In the case of the 256-bit encryption, it would take 2255 different combinations to break the key. If you were able to force one trillion keys per second, it would still take you somewhere in the region of 10 years in order to crack 256-bit encryption. ***However, a powerful computer can probably manage around two billion calculations per second,*** so in theory it would take 9.250 years for your standard desktop to crack it.

4. Choose one of the topics below and write an essay.

1. Vishing scams have become increasingly prevalent in recent years. To what extent do you think individuals should be responsible for protecting themselves from these attacks?

2. Some people argue that companies and organizations should take more responsibility for preventing vishing scams. Do you agree or disagree with this opinion?

3. With advancements in technology, vishing scams are becoming more sophisticated and harder to detect. What steps can individuals and companies take to stay ahead of these tactics?

UNIT 9

What is a Firewall?

A firewall is like a guardian angel for your computer. It shields you from the dangers of the digital world.

Marissa Mayer

BEFORE YOU READ.

1. Read the quote above and say whether you agree or not with it. Prove your answer.

2. Discuss the questions below.

1. How did system administrators block unwanted access before modern firewalls were introduced?
2. Can you give an example of how programmable chips filter data packets in a firewall?
3. Why is it important to have a defined set of rules for a firewall?
4. What are some potential consequences of not having a firewall in place?
5. Are there different types of firewalls? If so, what are they and how do they differ?
6. In your opinion, why is it necessary to constantly update and maintain firewalls?

Vocabulary

online safety ['seɪftɪ] – безопасность в сети

firewall breach ['faɪəwɔ:l breɪʃ] – нарушение брандмауэра

firewall ['faɪəwɔ:l] – брандмауэр, межсетевой экран

to block – блокировать

protection [prə'tekʃ(ə)n] – защита

hacker-proof ['hækəpru:f] – защищенный от хакеров

firewall settings – настройки брандмауэра

to restrict [rɪ'strɪkt] – ограничивать

cybersecurity [ˌsaɪbə'sɪkjuərəti] – кибербезопасность

network ['netwɜ:k] – сеть

to monitor ['mɒnɪtə] – контролировать

firewall software ['sɒftweə] – программное обеспечение брандмауэра

to protect [prə'tekt] – защищать

The data packets that come and go between your PC and the outside world can be defined by a set of rules. These rules state whether a packet has access to the system in the first place, then whether or not it can gain access to its destination program. Collectively, these rules make up a Firewall.

Great Walls of Fire

The term firewall comes from fire prevention, where a physical wall is constructed in order to halt the spread of a fire. In digital terms, the physical wall stops malware and other threats from spreading into the system. Some form of digital protection against unwanted entry into a system has existed for many years but the more recent software side of a firewall, one that we're reasonably familiar with, has only been around since the '80s.

Prior to the modern firewall, system administrators blocked unwanted access through various stages of hardware layers. Long lists of allowed computer addresses were painstakingly entered into mainframes and routers, where programmable chips filtered the white list and simply stopped all access to addresses that weren't on the list; think of a nightclub bouncer, if your name's not on the list you're not getting in.

In its simplest guise, a firewall will look to a defined set of rules then apply those rules to any data packets that pass through it. For example, if you've created a rule whereby all Telnet traffic is blocked, any packet that's trying to reach port 23, the port that Telnet applications listen on for data, will be blocked. While suitably effective this low-level packet filtering does have its Achilles heel, in that it treats each packet as an independent piece of data: not knowing whether it's a part of an already established stream of data. This can be targeted by hackers who want access to a system with a firewall in place. The clever hacker is able to spoof a packet and thus tricking the firewall into letting it pass. It takes some time, and it's a bit hit and miss, but most hackers have plenty of patience when it comes to getting into a network. Therefore a much needed higher degree of firewall monitoring is called for.

Stateful Inspection firewalls were introduced in the mid '90s and enabled a firewall to log all the connection that passed through it determining what was the start of a new packet stream, part of an existing packet stream or something random. This allows a firewall to allow or drop any access based on a data packet's history. In terms of effectiveness, this makes the firewall more efficient and faster at dealing with connection requests as it doesn't need to continually analyse each packet as an individual but rather as a whole stream. For added layers of protection, if a packet doesn't match any of the connection histories, then it can be evaluated and filtered through the various rules to determine its legitimacy.

A further layer of protection was included into the basic firewall early in the 2000s. Application-layer analysis enabled firewalls to inspect packets that were targeting individual applications within the operating system. Each program or application installed in the system will use a set of protocols to communicate with the outside world. When an application is installed, on a Windows 10 system for example, the installation mechanism will automatically add an instance of it to the Windows 10 firewall. This means that it is able to send and receive information successfully through the Windows firewall without any of it being blocked. By blocking an application's access to the outside world, the user could miss out on regular updates, fixes, patches and so on. One of the key benefits to an application-layer firewall is that it's excellent at blocking specific content, such as known malware and viruses or dangerous websites. It's also capable of determining when a particular protocol is being misused by a rogue application.

Where the firewall proceeds from this point is unclear. However many experts agree that although we'll always need a firewall, the modern systems, networks and devices have so many potential access points that it's fast becoming less efficient to run the standard firewall model. In effect, the modern firewall, regardless of how complex and efficient it has become over the years, is quick becoming a bottle-neck for the operating system. What some experts are theorising is that at some point in the future, the need for a single, overall firewall will be outdated and that the next- generation operating systems will require each program and application that can be installed to act as its own firewall. Whether this will come about is pure fantasy at the moment but at the speed digital technologies grow and evolve there's a good chance of finding out soon enough.

I. ELICITING THE VOCABULARY

1. Fill in the gaps using the words from the box.

requests, prevention, blocked, protection, software, programmable, packets, hackers, spoof, communicate, firewall, access

The data ____ (1) that come and go between your PC and the outside world can be defined by a set of rules. The term ____ (2) comes from fire ____ (3), where a physical wall is constructed in order to halt the spread of a fire. Some form of digital protection against unwanted entry into a system has existed for many years but the more recent ____ (4) side of a firewall, one that we're reasonably familiar with, has only been around since the '80s.

Long lists of allowed computer addresses were painstakingly entered into mainframes and routers, where _____(5) chips filtered the white list and simply stopped all access to addresses that weren't on the list. This can be targeted by _____(6) who want access to a system with a firewall in place. The clever hacker is able to _____(7) a packet and thus tricking the firewall into letting it pass. This allows a firewall to allow or drop any _____(8) based on a data packet's history. In terms of effectiveness, this makes the firewall more efficient and faster at dealing with connection _____(9) as it doesn't need to continually analyse each packet as an individual but rather as a whole stream.

A further layer of _____(10) was included into the basic firewall early in the 2000s.

Each program or application installed in the system will use a set of protocols to _____(11) with the outside world. This means that it is able to send and receive information successfully through the Windows firewall without any of it being _____(12).

2. Match the words with their definitions.

1. blocked	a. a security system that monitors and controls incoming and outgoing network traffic
2. firewall	b. small units of data that are transmitted over a network
3. programmable	c. measures taken to keep someone or something safe from harm, damage, or danger
4. protection	d. to imitate or mimic something, often with the intention to deceive
5. communicate	e. to exchange information or ideas through speaking, writing, or other means
6. spoof	f. programs and applications that run on a computer or electronic device
7. requests	g. formal or polite demands made for something to be done or provided
8. software	h. individuals who gain unauthorized access to computer systems for malicious purposes
9. access	i. prevented from passing through or accessing something
10. packets	j. the ability or right to enter, use, or retrieve information

11. hackers	mation from a computer system or network
12. prevention	k. capable of being programmed or customized to perform specific tasks l. the act of stopping something from happening or avoiding it altogether

II. COMPREHENSION

1. Read the text again and answer the questions.

1. What is a firewall and what does it do?
2. Where does the term "firewall" come from and how does it relate to digital protection?
3. How did system administrators block unwanted access before the modern firewall?
4. How does a firewall apply rules to data packets that pass through it?
5. What is the Achilles heel of low-level packet filtering in firewalls?
6. What are Stateful Inspection firewalls and how do they improve upon low-level packet filtering?
7. How does application-layer analysis enhance the functionality of firewalls?
8. What are some benefits of using an application-layer firewall?
9. According to the text, what might be the future of firewalls?
10. Why is it becoming less efficient to run the standard firewall model?

2. Read the text again and match the halves of the sentences.

1. «Hardware firewalls are	a. existed for many years.
2. Long lists of allowed computer addresses were painstakingly	b. can be defined by a set of rules
3. This can be targeted	c. access to the system in the first place, then whether or not it can gain access to its destination program
4. These rules state whether a packet has	d. entered into mainframes and routers.
5. Therefore a much needed higher degree of firewall moni-	e. were introduced in the mid '90s and enabled a firewall to log all the connection that passed through it

toring 6. Some form of digital protection against unwanted entry into a system has 7. Stateful Inspection firewalls 8. The term firewall comes from 9. The data packets that come and go between your PC and the outside world	f. fire prevention, where a physical wall is constructed in order to halt the spread of a fire g. is called for. h. an early example of network security» i. by hackers who want access to a system with a firewall in place
--	---

III. GRAMMAR IN CONTEXT

1. Choose the correct form of the adjectives in parentheses to complete each sentence.

1. Java is (popular) _____ programming language in the world.
2. This new software is (efficient) _____ than the older version.
3. Python is (easy) _____ to learn than C++.
4. Ruby on Rails is (powerful) _____ framework for web development.
5. The data analysis team is (skilled) _____ in using machine learning algorithms.
6. This computer is (expensive) _____ than the previous model.
7. JavaScript is (essential) _____ for front-end web development.
8. The new app has (impressive) _____ features than its competitors.
9. The network security system can't be (secure) _____ than it already is.
10. The UX designer created a (user-friendly) _____ interface for the website.

2. Transform Active to Passive.

1. The team develops a new software application.
2. We will install the latest security patches on all servers.
3. They updated the network infrastructure to support higher bandwidth.
4. The company released a new version of the mobile application.
5. He troubleshoot the technical issues with the website.

3. Transform Passive to Active.

- a) The router was configured by the network administrator.
- b) The software bug will be fixed by the IT team.
- c) The new applications are developed by the programmers.
- d) The operating system was installed by the technician.
- e) The IT specialists will install the new software update tomorrow.

4. Read the text and complete the exercises

- a) write a short summary to the text.
- b) find 5 sentences in the Simple Tenses in Active and transform them to Passive.
- c) find 7 adjectives in the text and write their comparative and superlative forms.

Protection for Young Adults. Problems with In-app Spending

The Internet is awash with horror stories from parents who have discovered that their child has spent an impressive sum on a game without their consent or knowledge; but, just how much of a problem is this in-app spending issue?

In-app spending is a modern scourge for parents, guardians and even the children and young people themselves. From the point of view of the parent or guardian, we have a child who enjoys playing a game, regardless of whether it's a mobile game, console game or triple-A rated PC game and we're more than happy to allow them to play the game without any restrictions, after all it's just a game, right? However, when those parents then receive the bill from their credit card company, or a call from the bank, that their account is now several hundred or even thousands of pounds lighter, that game has suddenly become the bane of their existence.

From the point of view of the child, they have an incredible and addictive game in front of them. They've put in the hours of game time to achieve a certain level but to get any further in the game, or to beat an end of the level boss or something, they need an extra push. That push can come in the form of more powerful spells, weaponry, armour or whatever else the game requires to boost the player's stats. To get hold of that equipment or bonus content, they need to purchase it from the in-game store. Some of the content costs just a few pounds but it soon lures them into the more expensive extras. Before they realise it, those few pound extras soon add up and the

straw that breaks the camel's back is the expensive object that pushes them into the new levels, and causes the parents much anger.

The developers and creators of the game have their point of view too. These developers have spent many hours of coding, testing, re-coding and marketing to help launch their game. It's a painful, exhausting and often expensive process, so the company that launches the game will need to see some good returns if it still wants to continue in business and employing developers, testers and everyone else involved. All these people involved with the game need paying, so if they can top up the business with in-app purchases, added content and such, then why not.

Of course, that doesn't help the parent or guardian who is now looking at their vastly diminished bank account. What there must be is some form of middle ground, where the developers still get paid and the company can keep producing exciting and great games. Here the players get to reach the levels they want and continue playing the game and parents and guardians can safely leave their children to play the game and purchase an upgrade or two, without breaking the bank.

5. Writing tasks:

1. Write a blog post explaining the importance of firewall protection in today's digital world. Discuss how firewalls prevent unauthorized access, protect personal information, and prevent hacking attempts. Use the target vocabulary to explain how firewalls work and why they are necessary.

2. Imagine you are a cybersecurity expert writing an article for a technology magazine. Write a detailed review of a programmable software firewall that you recently tested. Use the target vocabulary to describe its features, effectiveness in blocking access requests, and its ability to prevent spoofing and hacking attempts. Provide recommendations for readers who are looking for reliable firewall protection.

3. You have recently experienced a cyber attack where your personal data was compromised. Write an email to your internet service provider (ISP) expressing your concern and frustration. Use the target vocabulary to explain the situation, request an investigation into the incident, and demand better protection against hackers. Provide specific details about the attack and its impact on your personal information.

UNIT 10

What is a VPN?

Using a VPN will protect your access online and filter all your Internet traffic through its secure service.

BEFORE YOU READ

1. Read the quote above and suggest the best way to keep yourself safe online.

2. Discuss the questions below with your mates.

1. How does a Virtual Private Network (VPN) help ensure the security and privacy of your online activities?

2. Can you explain the concept of anonymity in relation to using a VPN? How does it allow users to remain anonymous while browsing the internet?

3. What steps can individuals take to ensure they are using a secure VPN service that offers reliable protection against malware and other threats?

4. Can you think of any instances where the use of a VPN might be considered illegal or unethical?

Vocabulary

Match the words and expressions with their equivalents in Russian.

1. illegal	a. вредоносное ПО
2. anonymity	b. анонимность
3. access	c. местоположение
4. remote	d. незаконный
5. built-in	e. сотрудники
6. resources	f. конфиденциальность
7. traffic	g. встроенный
8. protect	h. удаленный
9. digital	i. трафик
10. location	j. ресурсы
11. privacy	k. защищать
12. secure	l. безопасный
13. malware	m. соединять
14. employees	n. доступ
15. connect	o. цифровой

Your system may be secure to any online threats but it doesn't always mean your privacy is assured. This is where a VPN comes in, as it offers the user a heightened level of anonymity when online and even another level of security and protection.

Using a VPN can help hide your online presence. Whilst this may seem like an ideal way to get to illegal content, it's actually designed to help fight for your basic right to Internet and digital privacy.

Essentially, a VPN (Virtual Private Network) is a server or group of servers in a remote location that you can connect to through a client. The VPN servers then hide your Internet-bound IP address with their own, so if you connected to a VPN that's located in Australia then your IP address would be as if you were actually sat at a desktop down.

The benefits of this are many but mainly a VPN will allow you to access region restricted websites, protect you from tracking and shield your browsing activities from those who want to find out where you are personally based. Obviously there comes a negative side, in the form of being able to access content that your country has deemed illegal for some reason but on the positive, VPNs have allowed people in countries with extraordinarily tight restrictions to get access to the outside world; often enabling them to report on what's going on in their own country to the world.

However, for most users having a VPN means they're able to gain access to TV channels in the U.S., Canada, Europe and other parts of the world. It's not always about being able to moderately 'cheat the system' by forcing the Internet to think you're somewhere else other than where you actually are though. Remote workers and employees who live in other countries can connect to company VPNs and be able to use the company's network resources as if they were physically sat in the building.

The connection from your computer to the VPN server, via the client, is usually secure to the tune of 256-bit encryption levels, depending on the VPN company who is hosting the service. All your Internet traffic will filter through the VPN server's systems, offering multiple layers of protection from viruses, malware and privacy. Beyond the other possible scenarios, using a VPN whilst you're abroad, working in a hotel for example, will enable you to access your home country's services and work resources. One more element that's worth mentioning is that using Wi-Fi hotspots is one of the biggest security risk for travellers; using a VPN can effectively improve your security whilst using a café's free Wi-Fi.

Most operating systems come with the ability to connect to a VPN through their network settings. If you have the network and connection details of the VPN in question, then you're able to connect to it using the built-in Windows 10, Linux or macOS options. However, the more common, and in some respects, easier method, is to use the client which most VPNs now

offer as standard. The client is often simply a connection window that will ask you your login details, then provide a method of allowing you to connect to any of provider's geo-location servers, listed by country. Once the choice is made, you simply click the connect box and within a few seconds your IP address will be located within the chosen country.

There are plenty of VPN providers to choose from and we'll look at ten of the most popular in a while. Some offer a free connection service that's handy for quick browsing but isn't very fast. To gain access to faster servers, with better security and protection features you need to pay a monthly or annual subscription fee.

Thankfully it's not a lot, for the most part: you'll be expected to pay in the region of £5 to £15 per month. This grants you better coverage and the ability to use up to five or more different devices, including tablets and phones.

Over the coming pages we dig a little deeper into VPNs, as you can imagine, using one will significantly improve your protection when online. In terms of Windows 10 security, the use of a VPN is quickly becoming vital, so by the end of this chapter you'll be knowledgeable and helpfully utilising one to your own advantage.

I. ELICITING THE VOCABULARY

1. Fill in the gaps using the words from the table.

traffic, built-in, illegal, click, access, country, resources, remote, digital, location, connect (2), malware, protect, employees

Whilst this may seem like an ideal way to get to ____ (5) content, it's actually designed to help fight for your basic right to Internet and ____ (6) privacy.

Essentially, a VPN (Virtual Private Network) is a server or group of servers in a remote ____ (7) that you can ____ (8) to through a client.

The benefits of this are many but mainly a VPN will allow you to ____ (9) region restricted websites, ____ (10) you from tracking and shield your browsing activities from those who want to find out where you are personally based. ____ (11) workers and ____ (12) who live in other countries can connect to company VPNs and be able to use the company's network ____ (13) as if they were physically sat in the building.

All your Internet ____ (14) will filter through the VPN server's systems, offering multiple layers of protection from viruses, ____ (15) and privacy.

If you have the network and connection details of the VPN in question, then you're able to ____ (16) to it using the ____ (17) Windows 10, Linux or macOS options. Once the choice is made, you simply ____ (18) the connect box and within a few seconds your IP address will be located within the chosen ____ (19).

2. Match the words with their definitions.

1. malware	a. free from danger or harm; protected
2. secure	b. the condition of being unknown or unidentifiable
3. digital	c. the ability or right to use or obtain something
4. protect	d. already included as part of something; not separate or additional
5. privacy	e. the state of being alone or kept away from others; freedom from unauthorized intrusion
6. access	f. connected to or available through a computer or network
7. anonymity	g. join together or link physically or electronically
8. connect	h. against the law; not allowed by the authorities
9. illegal	i. software designed to disrupt, damage, or gain unauthorized access to computer systems
10. online	j. relating to or using technology that involves storing and processing data in electronic form
11. built-in	k. keep safe from harm or injury

II. COMPREHENSION

1. Read the text again and answer the questions:

1. What is a VPN and what does it offer to users?
2. How does a VPN hide your online presence and protect your privacy?
3. What is the main purpose of using a VPN?
4. How does a VPN server change your IP address?
5. What are some benefits of using a VPN?
6. Are there any negative aspects of using a VPN? If so, what are they?
7. Besides accessing region-restricted websites, what other uses do people have for using a VPN?
8. How does using a VPN improve security when connecting to public Wi-Fi hotspots?
9. How can you connect to a VPN on most operating systems?
10. What are some factors to consider when choosing a VPN provider?

2. Read the sentences and say which of them are advantages or disadvantages.

1. Trusting the security and privacy of your data to a third party server.

2. Keeps your online activities and personal information private through encryption.
3. Cost for high-quality VPN services may be expensive.
4. Allows access to region-restricted content and websites.
5. Can bypass internet censorship laws in certain countries.
6. Potential risk of fraud and scams associated with free VPN services.
7. Provides a secure connection when using public Wi-Fi networks.
8. Protects you from being tracked by advertisers, government entities, or hackers.
9. Slower internet speed due to data encryption and distance between VPN server and user.
10. Limited options for troubleshooting technical issues without advanced knowledge.

III. GRAMMAR IN CONTEXT

1. Complete the sentences using *must*, *should*, *may*, *can*.

1. You _____ use this software without proper authorization.
2. We _____ install the latest updates to ensure security.
3. Users _____ create strong passwords to protect their accounts.
4. You _____ backup all your data regularly to prevent loss.
5. Developers _____ follow coding standards when writing software.
6. You _____ report any suspicious activity immediately.
7. We _____ test the application thoroughly before releasing it.
8. Users _____ be careful while clicking on unknown links or opening suspicious emails.
9. You _____ check the system requirements before installing the software.
10. We _____ take measures to protect sensitive user information.

2. Choose the correct modal verb to complete the sentence:

1. You _____ install the latest software update to ensure security.
a) must b) should c) can
2. Employees _____ attend the cybersecurity training next week.
a) must b) should c) can
- Developers _____ complete the coding before the deadline.
a) must b) should c) can

4. Users _____ change their passwords every 90 days.

a) must b) should c) can

5. IT specialists _____ troubleshoot the network issue as soon as possible.

a) must b) should c) can

3. Using modal verbs *must, need, should, have to, may, be able to*, write a set of instructions for troubleshooting a network issue. Include the steps to diagnose the problem, potential solutions, and the expected outcome of each solution. Use modal verbs to indicate the level of certainty or possibility of each solution.

IV. READING COMPREHENSION

1. Make a summary to the text

2. Find all the sentences with modals and translate them into Russian.

Cyberbullying

Cyberbullying is when someone uses the Internet, email, online gaming, social media and any other kind of digital platform to threaten, tease, humiliate or upset someone else. Both the bully and the victim of the bullying can be any age, from very young children up to late teens, and beyond in some cases. The source of the bullying can come from others the victim knows at school or college, or from a complete stranger on the other side the world.

Bullying someone online doesn't always involve threatening remarks. What may seem like a playful comment on one side, could be taken as a cutting gibe on the other. It's not always an easy thing to specify, as we all have moments when we may say or do something to upset someone without meaning to do that person any emotional harm.

Probably one of the main platforms for cyberbullying, social media is an ideal hunting ground for the cyberbully. The effects of social media bullying have been devastating on some families. Teen suicides, self harm and elevated cases of depression amongst young people are popular in the media and bring to light just how powerful and dangerous social media is as a communications tool.

Facebook, Twitter, Instagram and other examples have all become the haunt of those who prey upon and harass others. From the point of view of a

child, whose emotional state is quite vulnerable, even a simple 'like' of a comment can embarrass or hurt.

Another prime source of modern cyberbullying, online gaming has proved to be a vicious place to inhabit for some. The problem with online gaming is that the bullying comes from anywhere in the world. There are cases of gamers targeting females, different religions or those who come from different parts of the world. With the use of headsets, the gaming cyberbullies are able to shout threats and taunt other gamers, rallying others around them until the victims feel overwhelmed by bullies.

There are numerous games which have adopted a more sport-friendly approach, introducing policies whereby instances of bullying can be reported and the bullies themselves have their gaming accounts suspended. Often online gaming bullying is just someone shouting 'noob' at another, degrading the victim as a newcomer, or someone who isn't as good as them. Other times the bully will say things like 'I hope you die' or 'I'm coming to kill you', or something similar. In short, any abusive behaviour, including destroying your online game creations or belongings, is a form of bullying.

With more and more young people having access to their own phones or tablets, abusive text messaging is becoming a major issue. Messages sent can, thankfully, be easily traced back to the source, and together with anyone else who was involved, the bully(s) can be reprimanded for their behaviour. Sadly though, there are ways to hide texts and with such knowledge, a cyberbully is able to send their abusive texts anonymously.

V. WRITING

1. Imagine you work for a technology company that provides VPN services. Write a persuasive email to a potential customer, explaining the advantages of your company's VPN service. Highlight the importance of protecting privacy, securing login details, and accessing online resources securely. Convince the recipient to sign up for a subscription.

2. Write a review of a VPN service you have recently used. Discuss its features, such as encryption levels, network resources, and protection against malware and tracking. Share your experience using the service and recommend it to others.

UNIT 11

Creating a Security Plan

The real danger is not that computers will begin to think like men, but that men will begin to think like computers.

Sydney J. Harris

BEFORE YOU READ

Read the topics and share your opinions.

1. Users are the weakest point of access for security on any system. What do you think?
2. Is it necessary to have a security plan for your Windows and home network? Why or why not?
3. How can regular OS updates and software patches improve your computer's security? Do you agree?
4. What are some potential areas of weakness that malware or hackers can exploit? How can we address them?
5. Creating a secure network involves considering all computers and devices. Do you agree with this statement? Why or why not?

Vocabulary

backup ['bækʌp] – резервная копия
update [ʌp'det] – обновление
malware ['mælwɛə] – вредоносная программа
exploit ['eksplɔɪt] – использовать
powerline adapter ['paʊəlɪn ə'dæptə] – сетевой адаптер
Wi-Fi coverage [ˌwaɪ'faɪ 'kʌv(ə)rɪdʒ] – покрытие Wi-Fi
security threat [sɪ'kjuərətɪ θret] – угроза безопасности
water-tight [wɔːtə(r)taɪt] – водонепроницаемый
tech-savvy ['sævi] – технически подкованный
security suites [sɪ'kjuərətɪ [swiːts] – пакеты безопасности
enhance [ɪn'hɑːn(t)s, en – усилить
to keep track – отслеживать
initialise [ɪ'nɪʃ(ə)laɪz] – инициализировать

Creating a Security Plan

A security plan will help you form a better strategy when it comes to tackling your Windows and home network security. A good plan will help keep on top of backups, updates and possible areas of weakness that malware or hackers can exploit.

Plan for the Worst, Hope for the Best.

There's a lot to consider when coming up with a good security plan. It's not just a case of occasionally checking for an OS update on your own computer, you have to take into account other computers and the entire network. An effective security plan should encompass the whole of your network, which includes Windows computers, Android and iOS devices, your router, any powerline adapters, Wi-Fi coverage, access passwords and even where the Ethernet cable runs through. It may sound a little extreme but like most checklist-type scenarios it can be as in-depth as you like. However, it's worth at least considering some aspects of the home network and overall security before starting a plan.

Users.

More than likely the 'user' is the most vulnerable point of access and the biggest security threat to any system or network. Whilst you can have the greatest AV suite and water-tight security system in the world, the user who carelessly visits unbelievable and obviously *fake deals.com* is the one that's going to cause you the most headaches. In a home network that's often youngsters, those who don't quite understand the whole Internet security element. Whilst most youngsters are more tech-savvy than us adults, there's an age range where they'll happily click a link from a friend or something they've seen that looks cool. Therefore take the time to educate and frequently check their accounts or computers for anything suspicious. If possible enforce limits to their browsing and regularly update the browsing rules to make sure they're not going where they shouldn't. Remember, it's not just viruses that a child can download, they could potentially see something that would affect them emotionally.

Updates.

Obviously a must-have section of a good security plan is to regularly check for system and program updates. Thankfully, Windows 10 and most security suites will run an automatic check whenever the system is powered up and connected to the Internet. However, there's always some point where an update failed to initialise for some reason or another. Therefore, it's often best to manually check. Consider too checking for updates for the most frequently used programs. Microsoft Office, GIMP, your browser and even games will inevitably have an update available which can enhance, protect and improve the security of the program. After that, make sure that the other installed programs on the system are up-to-date too, as it's best to make sure there's few weaknesses as possible.

Programs.

It can be difficult to keep track of what programs are installed on a system but it's not impossible. If you're serious about the security of your home network and its systems, then taking stock of what programs are installed on each system is worth doing. Running through a checklist of installed programs you may notice one that shouldn't be there. A quick lookup of the program may reveal that it's a popular backdoor for hackers to get into a system and the attached network. That being the case, it needs to be removed and any firewall entries checked and disabled.

I. ELICITING THE VOCABULARY

1. Match the equivalents.

1. a vulnerable point of access	a) учитывать другие компьютеры и всю сеть
2. to tackle network security	b) уязвимая точка доступа
3. to consider a good security plan	c) вызывать головную боль
4. a water-tight security system	d) когда система включена
5. to click a link	e) что-либо подозрительное
6. to cause headaches	f) надежная система безопасности
7. system and program updates	g) рассмотреть хороший план безопасности
8. the biggest security threat	h) вся сеть
9. a backdoor for hackers	i) самая большая угроза безопасности
10. the entire network	j) кликнуть по ссылке
11. anything suspicious	k) заниматься безопасностью сети
12. when the system is powered up	l) задний ход для хакеров
13. to take other computers and the entire network into account	m) обновления системы и программ

2. Fill in the gaps using the words in the box.

hackers, home network security, keep track, tech-savvy, checklist-type scenarios, malware, point of access, impossible

A security plan will help you form a better strategy when it comes to tackling your Windows and _____(1). A good plan will help keep on top of backups, updates and possible areas of weakness that _____(2) or _____(3) can exploit.

"Users form the most vulnerable _____(4) for security on any system. Educate and make sure they're safe."

It may sound a little extreme but like most _____(5) it can be as in-depth as you like. Whilst most youngsters are more _____(6) than us adults, there's an age range where they'll happily click a link from a friend or something they've seen that looks cool. It can be difficult to _____(7) of what programs are installed on a system but it's not _____(8).

II. COMPREHENSION

1. Read the text again and answer the questions

1. Why is it important to have a security plan for your Windows and home network?
2. What does the author mean by "Users form the most vulnerable point of access for security on any system"?
3. What should an effective security plan encompass?
4. Why is it worth considering aspects of the home network and overall security before starting a plan?
5. Who is often the most vulnerable point of access in a home network, and why?
6. How can you educate and protect users, especially youngsters, in a home network?
7. Why is regularly checking for system and program updates an important part of a security plan?
8. Which programs should be checked for updates in addition to the operating system?
9. Why is it important to keep track of installed programs on each system in a home network?
10. What should you do if you find a program that shouldn't be installed on a system?

2. Say whether the sentences are true or false. Correct the false ones.

1. A security plan helps in tackling Windows and home network security.
2. The user is the most vulnerable point of access for security on any system.
3. An effective security plan should only focus on Windows computers.
4. The user who carelessly visits fake websites is the biggest security threat.
5. Youngsters are usually more tech-savvy than adults.
6. It is not necessary to educate and check the browsing of youngsters in a home network.

7. Regularly checking for system and program updates is an important part of a security plan.
8. Windows 10 and most security suites automatically check for updates.
9. It is not necessary to check for updates for frequently used programs.
10. It is important to keep track of the installed programs on a system.

3. Read the sentences below and say which of them are advantages or disadvantages.

1. Enhances the security of your system and protects it from emerging threats.
2. Failed updates can cause frustration and disrupt the normal functioning of your system.
3. Updates can sometimes introduce new bugs or compatibility issues.
4. Fixes bugs and vulnerabilities, reducing the risk of cyber attacks.
5. Keeps your data safe by patching up any potential security loopholes.
6. Incompatibility with certain programs or devices may occur after updating.
7. Ensures compatibility with new hardware and software updates.
8. Manual update checks can be time-consuming and require regular attention.
9. Updates may interrupt ongoing work or result in system restarts.
10. Improves the performance and functionality of software programs.

III. GRAMMAR IN CONTEXT

1. Complete the following sentences using the correct form of the verbs in brackets. Use conditional sentences (first and second type) for each sentence.

1. If you (study) _____ more about programming languages, you would be a great software engineer.
2. If the system crashes again, we (need) _____ to find a solution quickly.
3. If they (work) _____ on the coding project now, they would finish it by tomorrow.
4. If you (attend) _____ the conference next month, you will gain valuable insights into the latest IT trends.
5. If users (provide) _____ detailed feedback, we can improve our software.
6. If the website (load) _____ faster, our users would have a better experience.

7. If the team (have) _____ better communication, the project would have been completed on time.
8. If we (implement) _____ this security feature, we can prevent unauthorized access to the system.
9. If he (learn) _____ HTML and CSS, he can build his own website.
10. If the network connection (drop) _____ frequently, we should contact the network administrator.

2. Choose the correct answer to complete each conditional sentence.

1. If I ____ the programming language Python, I would apply for that job.
- a) knew
 - b) have known
 - c) had known
2. We ____ the project on time if we work overtime this weekend.
- a) will finish
 - b) would finish
 - c) would have finished
3. If you ____ more hard disk space, you should consider upgrading your storage.
- a) need
 - b) will need
 - c) would need
4. If you ____ the latest security update, your system might be vulnerable to cyberattacks.
- a) install
 - b) will install
 - c) would install
5. He ____ a higher salary if he had more experience in web development.
- a) would earn
 - b) earns
 - c) will earn
6. If we ____ the software bug before the release, it will save us a lot of trouble.
- a) fix
 - b) will fix
 - c) would fix
7. If she ____ knowledge in data analysis, she could pursue a career in data science.
- a) has
 - b) will have
 - c) had

8. We ____ a backup system in place in case of data loss.
a) should have
b) will have
c) would have
9. If you ____ the login credentials, you can access the administrator account.
a) know
b) will know
c) would know
10. She ____ the project successfully if she manages her time efficiently.
a) will complete
b) completes
c) would complete

3. Read the text without a dictionary and try to understand it.

- a) Write a summary of the text
b) Find the sentences with *Present Perfect* and *Present Simple* and turn them into *Past Simple*.

Bitdefender Total Security 2019 Review

Bitdefender is regarded as one of the best antivirus and security companies in the world. Its products have won numerous awards and have been proved time and time again to be efficient and effective whilst offering cutting edge technology.

There's a lot to offer from Bitdefender's Total Security 2019. It's one of the leading security suites available and is cited as possibly the best total protection package in the world. Let's see what it has to offer.

Most of the problem with modern security suites is the heavy interface that comes with the package. A modern suite must include a wealth of elements to make it even slightly competitive in an already saturated and quite aggressive marketplace. This in turn creates an interface that's often too cluttered and a little overwhelming for the newcomer.

Bitdefender though, has managed to package together a clean and sleek setup, with the most prominent features available, with just a click or a couple of clicks of the mouse.

Naturally you can dig much deeper into the settings, selecting pre-defined profiles and modes, or tweaking the core to either lighten the secu-

rity, without compromising the overall defences, or tightening everything up to an almost NSA-level of security clearance.

It's packed full of interesting and useful features, some of which you never thought you'd appreciate until you actually had them to hand. For example, the vulnerability scanner will hunt down any missing Windows updates, issues with Wi-Fi security and even weak passwords. Integration with your browser is excellent, offering clearly defined green ticks next to search results that are classed as safe to visit, including integration with Facebook. You can also set up a secure vault for files that you want to mark as ultra-private and keep away from any prying eyes.

Ransomware is handled by an independent module that requires activation, once enabled it'll automatically protect files in your Documents folders, with the option to include other folders, too. Any attempt to edit one these protected files results in a message appearing, allowing you to confirm the action. This makes it increasingly difficult for ransomware to start encrypting and messing around with your valued data.

On top of all the superb features though, is the excellent scanning engine. The Bitdefender scan is quick and doesn't slow your computer down while being active in the background or while conducting a full system scan. In short, if you're in the market for a complete and fully featured security suite, then Bitdefender Total Security 2019 is the one you should most definitely consider.

V. WRITING

1. Write a social media post warning your friends about the importance of network security and how to protect their computers and networks. Use the target vocabulary to explain the potential risks and suggest ways to stay safe.

2. Imagine you are a blogger writing an article about the biggest security threat to computer networks. Describe what this threat is, why it is dangerous, and provide tips on how to prevent it. Use the target vocabulary to emphasize the importance of having a good security plan.

3. Compose an email to a friend, sharing your experience of encountering a suspicious link while browsing the internet. Explain what happened, why you were cautious, and how you protected your computer and network. Use the target vocabulary to describe the steps you took and emphasize the need for system and program updates.

UNIT 12

Identity Theft

Identity theft is a serious and growing problem, and one that can have devastating consequences for its victims.

Janet Napolitano

BEFORE YOU READ

1. Read the quote above and say whether you agree or not with it. Prove your answer.

2. Discuss the questions. Give reasons for your answers.

1. Have you ever heard of identity theft before?
2. What do you think identity theft means?
3. Do you know anyone who has been a victim of identity theft?
4. How can someone steal another person's identity?
5. Have you ever taken any steps to protect your own identity online or offline?
6. Are there any laws in your country that protect individuals from identity theft?
7. What advice would you give to someone who wants to avoid becoming a victim of identity theft?

Vocabulary

on the lookout ['lukaʊt] – начеку

protective measures [prə'tektɪv 'meʒə] – защитные меры

credit card fraud [frɔ:d] – мошенничество с кредитными картами

identity theft [aɪ'dentəti] – кража личных данных

data breach ['deɪtə breɪʃ] – утечка данных

security breach [sɪ'kjʊərəti breɪʃ] – нарушение безопасности

financial [faɪ'nænʃ(ə)l] **loss** – финансовые потери

personal information – личная информация

victim ['vɪktɪm] – жертва

cybercrime ['saɪbə,kraɪm] – киберпреступность

to hack into an account [ə'kaʊnt] – взломать учетную запись

to steal someone's identity – украсть чью-либо личность

better safe than sorry – лучше перестраховаться, чем потом сожалеть

keep your guard [gɑ:d] **up** – будьте настороже

Read the text thoroughly and find the appropriate title to it.

Identity theft is a serious crime that can have devastating consequences for its victims. It occurs when someone steals another person's personal information, such as their name, Social Security number, or credit card details, and uses it for fraudulent purposes. The thief may use the stolen information to open new credit accounts, make purchases, or even obtain medical treatment under the victim's name.

Identity theft can happen in many ways. For example, a thief might steal mail from a mailbox or dumpster to obtain personal information. They may also hack into a computer or phone to access sensitive data. Another common method is «phishing,» where the thief sends an email or text message that appears to be from a legitimate company, asking the victim to provide personal information.

To protect yourself from identity theft, there are several precautions you can take. First, always be careful with your personal information. Don't give out your Social Security number or other sensitive details unless you know the person or organization requesting it. Second, monitor your financial accounts regularly to detect any unauthorized activity. If you notice something suspicious, report it immediately to your bank or credit card company. Third, consider using identity theft protection services, which can help you monitor your credit reports and alert you to any suspicious activity.

If you do become a victim of identity theft, it's important to act quickly to minimize the damage. Contact your bank and credit card companies to report the fraud and cancel any affected accounts. File a police report and contact the Federal Trade Commission to report the incident. You may also want to place a fraud alert on your credit reports to prevent further damage. With prompt action, you can limit the impact of identity theft and protect yourself from future harm.

Choose the appropriate title to the text:

- Identity Theft
- How to Become an Identity Thief in 3 Easy Steps
- Understanding the Psychology of Criminals

I. ELICITING THE VOCABULARY

1. Insert the words from the box consulting the text.

victim's, purposes, steals, security, fraudulent, number, protection, precautions, social, suspicious, services, theft, accounts, financial

Identity _____(1) is a serious crime that can have devastating consequences for its victims. It occurs when someone _____(2) another person's personal information, such as their name, Social Security number, or credit card details, and uses it for _____(3) _____(4). The thief may use the stolen information to open new credit accounts, make purchases, or even obtain medical treatment under the _____(5) name.

To protect yourself from identity theft, there are several _____(6) you can take. Don't give out your _____(7) _____(8) _____(9) or other sensitive details unless you know the person or organization requesting it. Second, monitor your _____(10) _____(11) regularly to detect any unauthorized activity. If you notice something _____(12), report it immediately to your bank or credit card company. Third, consider using identity theft _____(13) _____(14), which can help you monitor your credit reports and alert you to any suspicious activity.

2. Match the words and expressions with their definitions.

1. personal information	a) when someone has taken your personal information and used it to pretend to be you
2. credit card fraud	b) when someone uses your credit card without permission to make purchases or withdraw money
3. cybercrime	c) criminal activities carried out using the internet or other digital technologies
4. security breach	d) being vigilant and watching out for potential dangers or threats
5. data breach	e) a type of security breach where confidential information is accessed by hackers or other unauthorized people
6. to steal someone's identity	f) staying alert and cautious in order to avoid becoming a victim of crime or fraud
7. stolen identity	g) details about you that can identify who you are, such as your name, address, or phone number

8. protective measures	h) actions taken to prevent something bad from happening, such as securing your passwords or monitoring your bank accounts regularly
9. on the lookout	i) an incident where unauthorized individuals gain access to sensitive information or systems
10. keep your guard up	j) to take someone's personal information and use it to impersonate them

II. COMPREHENSION

1. Read the text again and choose the right answers to the questions.

1. *What kind of personal information can be stolen in identity theft?*

- a) Name and address only
- b) Social Security number only
- c) Credit card details only
- d) All of the above

2. *How can a thief steal personal information from a mailbox?*

- a) By hacking into it
- b) By breaking into it
- c) By stealing mail from it
- d) By asking the owner for it

3. *What is «phishing»?*

- a) A way to catch fish
- b) A method of identity theft
- c) A type of computer virus
- d) A way to protect yourself from identity theft

4. *What can identity theft protection services do for you?*

- a) Alert you to any suspicious activity
- b) Steal your personal information
- c) Increase your credit score
- d) None of the above

5. *What should you do if you become a victim of identity theft?*

- a) Act quickly to minimize the damage
- b) Ignore it and hope it goes away
- c) Do nothing
- d) None of the above

6. *What should you do if you want to prevent further damage from identity theft?*

- a) Place a fraud alert on your credit reports

- b) Do nothing
- c) Wait and see what happens
- d) None of the above

7. *Can the impact of identity theft be limited with prompt action?*

- a) Yes
- b) No
- c) It depends on the severity of the theft
- d) None of the above

2. Discuss the situations and give your advice how to keep your personal information safe.

1) **Lily:** «Why do websites always ask for my personal information?»

Jack: «They need it to create an account for you or to process your order. But you should be careful and only give out your personal information to trusted websites.»

2) **Olivia:** «I think someone used my credit card without my permission!»

Ethan: «That's credit card fraud. You should contact your bank and report it. They can help you investigate and recover any financial loss.»

3) **Sophia:** «I heard about cybercrime on the news. What is it?»

Noah: «Cybercrime is any illegal activity that involves a computer or the internet, such as hacking, phishing, or spreading malware.»

4) **Emily:** «I just found out that my personal data was compromised in a data breach. What does that mean?»

William: «It means that someone gained unauthorized access to your personal information, such as your name, address, or credit card details. You should take protective measures to prevent identity theft.»

5) **Isabella:** «I lost a lot of money because of identity theft. What can I do?»

Lucas: «You can report it to the police and your bank, and they can help you investigate and recover any financial loss. You can also take protective measures to prevent it from happening again.»

3. Read the following statements and decide whether they are true or false. If the sentence is false, correct it.

1. Identity theft is a minor crime that doesn't have serious consequences.

2. Identity theft occurs when someone steals another person's personal information.

3. A thief can only steal personal information by hacking into a computer or phone.

4. Phishing is a method of identity theft where the thief sends an email or text message that appears to be from a legitimate company.

5. To protect yourself from identity theft, you should always give out your Social Security number to anyone who asks for it.

6. It's not necessary to monitor your financial accounts regularly to detect any unauthorized activity.

7. Identity theft protection services can help you monitor your credit reports and alert you to any suspicious activity.

8. If you become a victim of identity theft, you should act quickly to minimize the damage.

4. Put the words in the correct order to make sentences.

1. consequences / have / can / for / serious / a / its / is / victims / devastating / crime / that / theft / identity

2. in / many / identity / can / theft / ways / happen

3. thief / from / a / steal / or / dumpster / obtain / information / to / personal / mail / might / mailbox / for / a / example

4. computer / a / hack / to / also / into / they / access / may / data / phone / sensitive / or

5. take / to / can / identity / theft / protect / are / yourself / you / precautions / from / there / several

6. be / first / information / your / with / careful / always / personal

7. detect / unauthorized / regularly / any / financial / second / accounts / monitor / your / activity / to

III. GRAMMAR IN CONTEXT.

1. Complete these conditional sentences with the correct form of the verbs in brackets.

1. If you _____ (bring) your digital video camera, we can make a movie on my PC.

2. You won't be able to play those video files if you _____ (not have) the correct plug-in.

3. If the marketing manager _____ (have) PowerPoint, she could make more effective presentations.

4. If I could afford it, I _____ (buy) a new game console.

5. If I had the money, I _____ (invest) in some new multimedia software.

2. In pairs, discuss these questions. Use the second conditional.

What would you do if....

1 you had a digital video camera? *If I had a digital camera, I'd....*

2 you had a home recording studio?

3 you couldn't afford an iPod but you wanted an MP4 player?

4 you won a lottery?

5 someone stole your laptop?

3. Complete the following sentences using the appropriate conditional form.

1. If we _____ (fix) the bug, the software would work perfectly.

- a) fix
- b) fixed
- c) will fix

2. If the company _____ (invest) in new technology, it would improve efficiency.

- a) invests
- b) invested
- c) will invest

3. If you _____ (study) hard, you will pass the certification exam.

- a) study
- b) will study
- c) studied

4. If the software _____ (crash), we will lose all our data.

- a) crashes
- b) crashed
- c) will crash

5. If I _____ (have) more time, I would learn a new programming language.

- a) have
- b) had
- c) will have

6. If we _____ (finish) the project on time, we will get a bonus.

- a) finish
- b) finished
- c) will finish

IV. ADDITIONAL READING

1. Read the text and make a summary to the text.

2. Make up five conditional sentences using the text below.

Pharming

Pharming has become quite sophisticated in recent years, and with the rise of connected devices that offer Internet access it's quickly become one of the more popular criminal cyber activities.

Whilst on the subject of homophones, another recently added word to the long list of security threats is Pharming. Pharming falls within the online fraud layer of security and although in reality it's been around for as long as web pages have, the methods of deception are continually evolving.

So what exactly is pharming? In short, this is the criminal act of producing a fake website and redirecting the victims to it. The website could be anything from a reasonably popular online shopping store, to one of the well-known high street banks. The victim, unaware that the web site is fake, as the front end apes the real thing, even down to the small print at the bottom of the page, will login with their details.

After the user has logged in several options are available to the 'pharmer'. They can collect the username and login details and simply leave the victim with a blank web page; this is usually a method used by an amateur pharmer or those who want a quick username and password grab before disappearing into the darkened comers of the Internet. Otherwise, they can redirect the victim to the real site where they need to enter their login details again. The latter is a more convincing method of pharming, as the victim rarely questions why the bank has asked for their login credentials twice, they often put this down to a mistaken entry on their part.

Either way, the pharmer now has a considerable list of valid usernames and passwords for the bank. or online shop they faked, which they can then sell via the Dark Web or use themselves. How do they, the pharmers, get away with being able to do this? Interestingly, there are several ways in which someone can fake a legitimate website.

3. Choose any topic below to write an essay.

1. How I protect myself from online fraud and cyber attacks.
2. My favorite tips for staying safe online.
3. How technology can help us stay safe from online threats.
4. How can we educate others about the dangers of online fraud and cyber attacks?

TEXT FOR SELF-STUDY

TEXT 1.

How Does Information Move Around the Internet?

Before we get into online protection and disaster recovery, it's worth taking a moment to look at how information moves around the Internet, in particular your information. Just how is data sent from your PC across the Internet, to potentially fall into the hands of someone else?

The Internet is a huge, complex network of computers and is widely credited as humanity's greatest achievements. It's estimated that the Internet houses something in the region of 10^{24} bytes of information, which is quite a lot.

That estimated 10^{24} bytes equates to an exabyte of potential information held by every single connected device that makes up the Internet, some of which is your information. It's an impossible number to visualise, since we're only using gigabytes or terabytes of storage in most of our devices. More to the point though, how on earth does all that connect together, and how does it work?

To be able to transmit all that information, the data that travels around the Internet is in packets. Each of these packets contains a header and a footer. The information stored in the header and footer contains the details regarding the data being sent. For example, if you send an email to someone, as soon as you click the send button the data will be wrapped up in headers and footers, split into numerous packets and sent on its merry way.

The protocols used throughout the Internet define what the data being communicated actually is. For example IMAP, Internet Message Access Protocol, is a mail protocol for accessing email on a remote server, such as accessing Gmail. These protocols help further the transmission of data to its intended location, making it more accurate and telling the computer on the other end what it is and how to piece together the jigsaw puzzle of packets that will be received.

Essentially this is how information is sent and received around the Internet. Obviously, there's a lot more going on in the background than we've mentioned here. The complexity that you can go into when dealing with data transfers is quite staggering and a little bewildering at times. Suffice to say, all those packets of data contain information about something or someone and somewhere out there are packets of data that contain information about you, where you are, what you're doing, and other personal details such as bank accounts, passwords, names and addresses.

Answer the questions to the text:

1. How is data sent from a PC across the Internet?
2. What is the estimated amount of information held by every single connected device on the Internet?
3. What are packets and what do they contain?
4. How do protocols help in transmitting data to its intended location?
5. Is there more complexity involved in data transfers than mentioned in the text? If so, what are some examples?
6. What kind of personal details can be contained in packets of data?
7. What is the author's opinion about the complexity of data transfers on the Internet?

TEXT 2.***Why Updating Is Important?***

In today's fast-paced world, it is more important than ever to stay up-to-date with the latest information and technology. Whether it's in our personal lives or in our professional careers, being current can make a significant difference. Here are three reasons why updating is essential.

Firstly, updating ensures that we have access to the most recent features and improvements. Take smartphones, for example. Every year, mobile phone manufacturers release new models with advanced capabilities and enhanced user experiences. These updates may include improved camera quality, longer battery life, or faster processing speeds. By upgrading to the latest model, we can enjoy these benefits and stay ahead of the curve. Similarly, software developers regularly release updates to fix bugs, address security vulnerabilities, and introduce new functionalities. Failing to update our devices and applications means missing out on these valuable enhancements.

Secondly, updating helps us stay secure and protected. In this digital age, cyber threats are becoming increasingly sophisticated and widespread. Hackers are constantly discovering new vulnerabilities to exploit, and software companies must respond by issuing regular security patches and updates. By installing these updates promptly, we can safeguard our devices and data from potential attacks. The same applies to antivirus software, which relies on frequent updates to detect and neutralize the latest malware. Neglecting to update our security systems puts us at risk of falling victim to cybercrime, such as identity theft or financial fraud.

Lastly, updating allows us to adapt to changes and remain competitive. Industries and markets are constantly evolving, driven by advancements in technology, shifts in consumer behavior, and changes in regulations. To succeed in today's business landscape, organizations need to be agile and re-

sponsive. This often involves adopting new strategies, embracing emerging technologies, and rethinking outdated practices. Companies that fail to adapt risk being left behind by their competitors. Likewise, individuals who resist change may find themselves struggling to keep pace in their careers. By staying informed and continuously updating our skills and knowledge, we can remain relevant and competitive in a rapidly changing world.

Of course, there are situations where updating may not be necessary or appropriate. For instance, if a particular feature or improvement does not benefit us or align with our needs, then there may be no need to upgrade. Additionally, some updates may introduce new issues or conflicts, which could disrupt our workflows or cause compatibility problems. In such cases, it is important to assess the risks and weigh the potential benefits before making a decision.

In conclusion, staying up-to-date is crucial for several reasons. It allows us to access the latest features and improvements, stay secure and protected, and adapt to changes in our personal lives and careers. By embracing updates, we can make the most of the opportunities that come our way and ensure our continued growth and success.

Choose the appropriate answer to the questions:

1. According to the text, why is updating important?

- A. It allows us to access the latest features and improvements.
- B. It helps us save money.
- C. It ensures that our devices will never break.
- D. It guarantees that we will always be ahead of our competitors.

2. What is one example the text gives of updates in smartphones?

- A. Better battery life.
- B. Thinner design.
- C. Increased storage capacity.
- D. Faster charging speed.

3. According to the text, why do software developers release updates?

- A. To slow down the performance of our devices.
- B. To add unnecessary features.
- C. To fix bugs and address security vulnerabilities.
- D. To make our devices incompatible with other software.

4. What is the main benefit of staying up-to-date with security updates?

- A. It allows us to detect and neutralize malware.
- B. It helps us save money on antivirus software.
- C. It guarantees that we will never be targeted by cybercriminals.
- D. It ensures that our devices will never be hacked.

5. *Why is it important for organizations to update their strategies and technologies?*

- A. To stay ahead of their competitors.
- B. To increase their expenses.
- C. To make their employees unhappy.
- D. To create unnecessary confusion.

6. *What should individuals do to remain relevant and competitive in their careers?*

- A. Never update their skills and knowledge.
- B. Ignore changes happening in their industry.
- C. Continuously update their skills and knowledge.
- D. Resist any form of change in their workplace.

7. *According to the text, when may updating not be necessary or appropriate?*

- A. When the updates are too expensive.
- B. When the updates do not benefit us or align with our needs.
- C. When the updates are too complicated to install.
- D. When the updates are only available for certain devices.

TEXT 3.

Be Smart

We've looked at some of the many varied ways in which you can be compromised by a digital attacker and some of the ways in which you can help protect yourself. However, it's often more beneficial to be able to recognise the signs of a digital security issue.

In terms of digital security, you're only as strong as the weakest link in your security chain. You can tick all the security boxes but if you don't know what to look for in the first place you're still vulnerable.

PASSWORD CHANGE. A good sign of a breach in your digital security is the sudden changing of a password. It can be for a random site, web-mail or just something small to begin with. Sometimes a hacker with a key-logger in place will test the water before accessing your bank, in which case you need to virus scan your PC immediately.

PERSONAL SPAM. We all receive spam emails of some form or another. However, if you suddenly start getting emails of a more personal nature, then you need to look at where that information could be coming from.

The details could be your full name, date of birth, knowledge of any children or even a recent accident you may have been involved with.

BANK ACTIVITY. If you check your bank activity regularly and you've noticed some odd, small transactions that you fail to identify, then your account could already be hacked. Sometimes hackers will take small amounts or purchase inexpensive items to check the validity of an account before emptying the vault as it were. Contact your bank immediately.

SLOW PC. One of the many signs of your computer being infected by a virus is the sudden slowing down of the overall system. Most operating systems, Windows in particular, slow down over time but if you power up your computer one day and it's noticeably slower than usual we'd recommend you run a virus scan.

SLOW BROWSER. In relation to the previous tip, a browser slow down can also indicate that something is potentially going on. Browser hijacking can adversely affect the speed at which pages load, as it's sending information to a remote source. Naturally it's not always a digital security issue but to make sure, check your system.

RANSOMWARE WARNING. In the case of a ransomware attack, you don't often get much warning that something is about to happen. Generally speaking, a sudden and inexorable slowing down of your computer will be a key element, as the ransomware is frantically encrypting your files in the background.

Say whether the statements are true or false:

1. Recognizing the signs of a digital security issue is not important for protecting yourself.
2. If you notice a sudden change in your password, it could be a sign of a breach in your digital security.
3. Personal spam emails often contain information like your full name, date of birth, or recent accidents.
4. Odd, small transactions in your bank activity could indicate that your account has been hacked.
5. A slow computer can be a sign of a virus infection.
6. A slow browser cannot indicate a potential digital security issue.
7. A sudden and inexorable slowing down of your computer is a warning sign of a ransomware attack.

TEXT 4.

Kaspersky Total Security 2019 Review

Kaspersky was one of the first security companies to offer the end-user a cross platform AV protection suite, some years ago now. Since then, the company has improved its products staggeringly and as such is now one of the leading security suites available.

There are a lot of features to like about Kaspersky Total Security 2019, all of which help you not only be protected from whatever's out there, but also better manage your system. Kaspersky's Total Security 2019 is the mega-product of the company's AV and protection utilities for home users. Much like the Bitdefender entry, Kaspersky has gone to great lengths to provide an easy to use and simple to understand interface. While, again like Bitdefender, you're able to delve deeper into the inner workings, the average user isn't instantly bewildered by pages upon pages of technical jargon, icons and sub-menus. It's handy too that everything starts from the Kaspersky online portal, where you'll download your purchased software, alongside installers for other modules that eventually all fall under the same umbrella control centre.

The front-end categories that are available via the control centre are: Scan, Database Update, Safe Money, Password Manager, Privacy Protection, Backup and Restore, Protection for all devices and Parental Control. Most are fairly self-explanatory, however, components such as Safe Money and Privacy Protection deserve a little more detail.

Safe Money utilises Kaspersky's unique protection engine, whereby your online transactions are safely behind the product's security web. This feature takes care of protecting your shopping, as well as online banking, so it's an impressive weapon in the already ample Kaspersky arsenal.

Privacy covers a range of different features. The core component protects you while surfing, guarding your online identity and information, while also actively blocking malicious websites and preventing any form of tracking or monitoring. It also includes an element that blocks any attempts to access your computer's webcam, which is certainly a handy feature and it'll block any attempts to access your stored data while you browse the Internet.

One last component worth mentioning is the Parental Control feature. With this, Kaspersky offers a method of keeping children safe while they use their devices. You can create usage scheduling, GPS safe zones and receive notifications should anything suspicious attempt to access your child's device when they're using it. Beyond that, there are also filters to stop children accessing adult sites, or sites that can feature disturbing content.

Kaspersky Total Security 2019 is an impressive product and one that the home user can certainly feel confident about. It's quick, easy to use, regularly updated and ticks all the right boxes from the point of view of a user, parent, and someone who wants to make sure they're as secure as possible on the modern Internet.

Answer the questions to the text above:

1. What are some features of Kaspersky Total Security 2019?
2. How does Kaspersky make its interface user-friendly?
3. What is the purpose of the Safe Money feature in Kaspersky Total Security 2019?
4. How does the Privacy Protection component of Kaspersky Total Security 2019 work?
5. What does the Parental Control feature in Kaspersky Total Security 2019 offer?
6. Why is Kaspersky Total Security 2019 considered an impressive product for home users?
7. How does Kaspersky ensure that its security suite stays up to date?

TEXT 5.

How Can Internet Data be Intercepted?

We've seen how data travels around the Internet in packets and with the help of various protocols that determine its source, destination and what manner of data packet it is. While that's all well and good, it's worth knowing how a hacker goes about intercepting that information. The data packets that make up a message, or a string containing a username and password, are sent to and from yours and other computers without most of us ever really knowing what's going on in the background.

It's this lack of knowledge that's the hacker's greatest tool. Well, that and some clever software that's freely downloadable from the Internet. Let's look at how data can be intercepted by a hacker. Let's use the scenario that you're on a business trip, or just out and about, and you're using a café's free, public Wi-Fi. There are numerous, and quite ingenious, ways in which data can be intercepted by a hacker.

The first and most notable form of attack is called MITM or Man In The Middle. This attack utilises a set of free tools that can essentially grab data packets from the locally used network. This means that the data packets leaving your computer must travel through the free Wi-Fi's network before going off into the Internet to its destination. The MITM attacker can sniff

out this data, intercept the stuff that looks interesting, which can be done by reading the headers and footers and determining what the message/information contains, and decode it to view in plain text on their computer.

Normally you need to be using an unsecure network, such as a public Wi-Fi but there are other ways and means. Think of this form of attack as a postman opening a bank statement letter, writing down all your bank details, then sealing the envelope before posting it through your door. The data packets are easily intercepted on the free Wi-Fi and unless you're using a HTTPS site, they take very little effort to decode and read.

Whilst not a technical way of intercepting data, hackers will still use the old tried and tested method of stealing information simply by sitting close to you and peering over your shoulder whilst you enter login details or write an email.

It doesn't take much skill, as we're usually so busy concentrating on other things that we often fail to notice someone looking over our shoulder. However, it's a real and credible threat, so be wary.

Say whether the statements are true or false:

1. Data packets travel around the Internet without most people knowing what's going on.
2. Hackers can intercept data packets by utilizing a set of free tools.
3. MITM attack stands for Man In The Middle attack.
4. MITM attackers can only intercept data on unsecure networks.
5. Hackers can easily decode and read intercepted data packets from a public Wi-Fi.
6. HTTPS sites are immune to data interception.
7. Hackers can steal information by physically looking over someone's shoulder.

TEXT 6.

How to Secure Yourself on Twitter

Twitter's success has boomed in recent years. Where once it was simply one of the more popular social media platforms, thanks to presidential candidates and scores of celebrities, it's fast become the modern media phenomenon.

Sadly, due to its popularity, Twitter is a hotbed of scammers, spammers, hackers and social engineers scouting out the next potential victim for monetary gain, or simply behaving abusively. Here are ten tips to help secure your Twitter account.

1. If you click on your profile picture and choose Settings and Privacy from the menu, you're able to set up a form of two-factor authentication

called Verify Login Requests. This will enable Twitter to use your phone number to send texts for any login requests. So even if your password is compromised, the hacker can't get in without the text code.

2. Just like most other social media platforms, phishing scams are rife on Twitter. Be wary of anyone sending you Tweets claiming to be someone you know, offering a too-good-to-be-true job or even informing you that your account is compromised. It's likely a phishing scam, so delete and report the instance to Twitter.

3. We've previously mentioned the fact that using weak passwords is, unsurprisingly, not recommended. However, you'd be amazed at how many people still use the likes of 'password1234' or something similar. Set a good, strong password that will take some cracking.

4. There are many accounts on Twitter that simply aren't real. These bots, as they're known, can be programmed to post daily amusing, inspiring and socially acceptable Tweets. On the flip side, other bots are designed to Tweet suspicious links to virus-infested websites. In short, unless you trust the account, don't follow any links.address too.

5. Within your account settings, you'll see a menu to the left with a Privacy and Safety option. Click this to enable Twitter privacy, Discoverability, Direct Message notifications, the ability to hide sensitive Twets and the removal of blocked accounts. It's worth going through the list to future secure your account.

6. Direct Massaging in Twitter is both advantageous and dangerous at the same time. Whilst great for communicating directly with another user, it's also used by others to lure in victims or send links to malicious websites. It's best to ignore most messages unless you know who they're from.

7. If you use your Twitter account to login into third-party apps or games, then you may need to consider setting up a secondary Twitter account. Whilst convenient, some apps can be hijacked to collect account details, leaking them to hackers.

8. It's always worth browsing through the Apps section in the Twitter options. This is where you can allow or revoke access for any apps you've used via the Twitter account; and you can also see what rights each app to your Twitter account.

9. Word Muting is an excellent feature within Twitter's account settings. With it you're able to mute any words you don't want to see in your notifications or timeline. There are often Tweets you'd like to avoid even seeing in your timeline, so muting them is an ideal solution to help keep your account clean and free from negative aspects.

10. Like Facebook, be careful of what you post. It's nice letting others know you're off on holiday to the Bahamas for several weeks but there could be a rogue account that's now informed of an empty house; and if you were foolish enough to mention your address in previous Tweets, they know exactly where to go.

Choose the appropriate answer to the questions:

1. What is the purpose of enabling Verify Login Requests in Twitter settings?

- A. To prevent scammers from sending phishing scams.
- B. To secure your account with two-factor authentication.
- C. To receive text codes for login requests.
- D. To protect your password from being compromised.

2. According to the text, what should you do if you receive a suspicious Tweet claiming to be from someone you know?

- A. Reply to the Tweet and ask for verification.
- B. Report the instance to Twitter and delete the Tweet.
- C. Click on any links provided in the Tweet to verify its authenticity.
- D. Ignore the Tweet and continue using Twitter as usual.

3. What is the recommended approach for setting a password for your Twitter account?

- A. Use a password that is easy to remember.
- B. Set a password that includes common phrases.
- C. Create a strong and difficult-to-guess password.
- D. Use the same password for all your online accounts.

4. What does the text say about Twitter bots?

- A. They are programmed to post malicious links.
- B. They can only post amusing and inspiring Tweets.
- C. Following links from trusted accounts is safe.
- D. It is best to avoid following links from unknown accounts.

5. What can you do in the Privacy and Safety settings of your Twitter account?

- A. Enable Discoverability and Direct Message notifications.
- B. Hide sensitive Tweets and remove blocked accounts.
- C. Disable two-factor authentication and password recovery.
- D. Allow access to third-party apps and games.

6. How should you approach direct messages in Twitter?

- A. Respond to all messages to maintain good communication.
- B. Ignore messages unless you know the sender.
- C. Click on links provided in messages to access relevant content.
- D. Use direct messages to share personal information.

10. Why should you be careful about what you post on Twitter?

- A. It can lead to your account being hacked.
- B. It can attract unwanted attention from scammers.
- C. It can expose personal information like your address.
- D. It can result in negative aspects appearing in your timeline.

TEXT 7.

Whatsapp Security Tips

With over a billion users worldwide, WhatsApp is proving to be a force to be reckoned with in the social media marketplace. This messaging app was released over eight years ago and developed by the Facebook team; since then it's become the most popular messaging app.

With this popularity comes a darker side to messaging. Accounts of terrorists using WhatsApp, along with hackers, scammers and all manner of nefarious individuals and groups are ever in the popular media.

Protecting your WhatsApp account can be done mainly through the Settings > Account > Privacy option. In here you're able to secure your personal details, profile, status, messaging and who can see your account. Your messages and calls are secured with end-to-end encryption, which means WhatsApp and third parties can't read or listen to them.

Thankfully, WhatsApp already encrypts and secures messages sent from one device to another. This means that your data can't be intercepted and read. However, you can opt to view security notifications if a contact's security setting has been altered. This is in the Settings>Account>Security menu.

For added security you can opt for two-step authentication, which will require a PIN when registering your phone number with WhatsApp. This is an absolute must for those who use the app regularly.

Beyond WhatsApp itself, make sure that your phone or tablet is securely locked with an access PIN, pattern, facial or finger print recognition system. This way, should you lose your phone, it will be locked against anyone who tries to access it and WhatsApp.

Answer the questions to the text:

1. How can you protect your personal details and messaging on WhatsApp?
2. What does end-to-end encryption mean for messages and calls on WhatsApp?

3. Can third parties read or listen to your messages and calls on WhatsApp? Why or why not?
4. What are security notifications in WhatsApp, and how can they be useful?
5. What is two-step authentication, and why is it recommended for regular users of the app?
6. Besides securing WhatsApp itself, what other security measures should you take to protect your account?
7. What is the author's opinion on the importance of securing your WhatsApp account?

TEXT 8.

Windows 10 Privacy Settings

Windows 10's new updates and special edition updates have brought a more customisable degree of control over the operating system's privacy configuration; something that Microsoft has always been criticised for in the past.

There are many advantages to this particular setup. A Windows 10 user will always be up to date with regards to security, options and support. Any new hardware that's released will be added to the vast driver database that Windows 10 already uses and it will operate at its maximum potential. Microsoft can gradually roll out features that would require a brand new operating system, thus maximising the capabilities of the OS. Of course, the company can charge for certain additional features that would ordinarily be a part of the OS, such as a media centre for example.

Providing you've applied the Fall Creators Update, you can view the current privacy options by clicking the Windows Start button and typing privacy into the search box. Click on the Privacy Settings option, with a padlock icon, and the core privacy options window will open. There are, at the time of writing, nineteen different options available to browse through. Each option, when clicked, will display a subset of available options that can then be enabled or disabled and turned on or off, depending on your preference.

For example, the first option, General, offers the user a choice of opting for advertising via apps, allowing websites to provide locally relevant content based on the user's language list and allowing Windows 10 to track how an app is launched to improve search results. Whilst that in itself doesn't sound too much like your privacy is being infiltrated, there are those who don't want the installed apps and the OS having too much knowledge of where they are and what to advertise. Like most privacy options, it's a per-

sonal preference as to what you're happy sharing with the system and its connected technologies. Whilst opting to turn every privacy setting on will inevitably open your use of Windows 10 up to whoever or whatever is readily receiving the information, likewise turning everything off will effectively hide you (to some degree); but at the cost of possible loss of available features. There's a fine balance needed to get the best from your privacy and still enjoying Windows 10's many features.

Answer the questions to the text:

1. What advantage does Windows 10's new updates and special edition updates bring?

- A. They provide better security options.
- B. They offer free additional features.
- C. They increase the operating system's privacy control.
- D. They improve the search results on Windows 10.

2. How can a Windows 10 user access the privacy options?

- A. By clicking on the Windows Start button and typing "privacy" in the search box.
- B. By clicking on the Privacy Settings option with a padlock icon.
- C. By enabling or disabling specific options in the core privacy options window.
- D. By applying the Fall Creators Update.

3. What does the General option in the privacy settings allow the user to do?

- A. Opt for advertising via apps.
- B. Enable location tracking for installed apps.
- C. Improve search results for launched apps.
- D. Provide locally relevant content based on the user's language list.

4. What is the writer's stance on turning all privacy settings on or off?

- A. It is necessary to enjoy all of Windows 10's features.
- B. It is the best way to protect your privacy.
- C. It is a personal preference that depends on the user's comfort level.
- D. It should be avoided to prevent loss of available features.

5. What is the cost of turning all privacy settings off?

- A. Loss of available features.
- B. Infiltration of personal information.
- C. Improved search results.
- D. Increased advertising via apps.

TEXT 9.

What is a Sandbox?

Sandboxing is an important security technique that's used by companies and individuals the world over. It's not something the average user will normally come across but you can guarantee that every piece of software you use has been sandboxed at some point in its development.

Playing in the Sand. Everyone from software developers and security experts to the hackers themselves will use a sandbox environment to help build and test their products; so what exactly is a sandbox?

Just as the name suggests, a sandbox is a place where you can do something without it affecting the surrounding area: visualise a sandbox in the middle of a garden. In digital security terms, this means a sandbox is a tightly controlled environment that's isolated from the main operating system where a person can test or analyse software and its impact on a virtual system.

The sandbox can be one of a number of implementations: web based, operating system based, program based, network based or even emulating interaction with the Internet. There are countless more examples, each depending on what exactly is being tested and what functions are required to complete the test.

Imagine that from the point of view of a hacker, then. The hacker has developed a particularly nasty piece of code that could bring down government agencies and cause widespread panic among the global digital community, they're hardly going to test it on their own computer. They need to create a sandbox environment whereby they can trigger the malware, ransomware or whatever, and let it run its course. In the meantime they can run through various procedures to try and wipe the malware, as a security expert would, to find any weaknesses. Once they've perfected the malware and wiped out any perceivable vulnerabilities, they can then happily upload it to the Internet and sit back as the world is infected with their code.

It's generally accepted then that when testing in a sandbox it's advisable to use as common a hardware and software setup as possible. This way, the developer will likely create a program that works on as high percentage of the computer available. Those computers that differ from the norm, and that may require a little more work for the product to install and work on, can then be dealt with through minor patching and bug testing.

Well, there are ways in which you can create your own sandbox environment to test in. Consider how many times you've downloaded software from the Internet and executed it with even examining how it may affect your computer. How many times do you visit websites and happily click

on whatever message may appear without even reading it properly. With your own sandbox environment, you can download and install piece of software and see how it runs within a test setup without it ever impacting your real machine. If you get into the habit of testing every bit of software in sandbox first, you'll certainly be glad if you discover a hidden virus in the folds of an otherwise harmless looking program.

Answer the questions to the text:

1. What is sandboxing and why is it important in digital security?
2. How does a sandbox work in terms of isolating software from the main operating system?
3. What are some different implementations of sandboxes?
4. Why would a hacker use a sandbox environment to test their malware or ransomware?
5. Why is it advisable to use a common hardware and software setup when testing in a sandbox?
6. How can individuals create their own sandbox environment for testing software?
7. What are the potential benefits of testing software in a sandbox before installing it on your real machine?

TEXT 10.

Online Child Protection. Social Media and Children

The impact of social media on children has been the subject of numerous reports over the last few years. With more and more children and young people gaining access to Facebook, Twitter, WhatsApp, Instagram and so on, there's a growing concern as to how it's affecting online safety. any site or portal where some form of social interaction occurs can be classed as social media, so even if you don't allow your children access to Facebook at all, there's still a chance they're in contact via gaming or an app of some description: YouTube, blogs, etc.

Reports from the American Academy of Paediatrics has found that using social media does provide benefits for young people. According to findings, regular use of social media platforms enhances communication, social connections and technical skills. Not only that, it allows young people to connect with extended family members and friends they won't see for perhaps years at a time, as they live in places they're not likely to visit. Depending on the content, social media can help a young person develop better perspectives on various issues in the media and when talked about with an adult, they can begin to form their own opinions, an impressive stage in a

young person's life. All in all, it adds up, on paper at least, to a positive experience that can greatly help a young person grow and help them form a more mature understanding of the world around them; something we didn't have before the Internet.

Sadly, with every positive aspect there are several negatives. Cyber bullying is rife on social media. From threats made to young people, to digs at their appearance and body shaming, it's a platform that has quickly devolved into a pit of despair and depression for some unfortunate youngsters. This can lead, in extreme cases, to fatal consequences but generally the collective term for the negativity plied upon the youth of today is 'Facebook Depression: In recent months, the Royal Society for Public Health together with the Young Health Movement released a survey that revealed Instagram to have the negative impact on a young person's mental wellbeing, accusing the media platform of deepening young people's feelings of inadequacy and anxiety.

Mental health is a major concern amongst young people but social media also presents its darker side through online grooming, potential radicalisation and the spread of malware. Each of these will greatly affect a young person and can lead to higher levels of anxiety, depression and withdrawal.

Therefore, the pressure on parents and guardians is just as immense, when helping our young people navigate the digital wild west frontier that is social media.

Guess whether the statements are true or false:

1. Social media has no impact on children's online safety.
2. Social media platforms enhance communication, social connections, and technical skills for young people.
3. Social media can help young people develop better perspectives on various issues in the media.
4. Cyberbullying is not a problem on social media.
5. Instagram has a positive impact on a young person's mental wellbeing.
6. Mental health is not a major concern among young people.
7. Online grooming, potential radicalization, and the spread of malware are some of the negative aspects of social media.

TEXT 11.

Online Child Protection. Email & Child

We're often so concerned over social media, online gaming and chat sites that we tend to ignore one of the most common threats to online safety for young people and children, email. While it's a more manageable element, it does carry plenty of dangerous potential.

In reality it doesn't take too much of a technical genius to enter into a search engine, "fake email accounts" or something similar. The returned results, such as Fake Email Generator, Mailinator, ThrowAwayMail and FakeInbox are all designed to help you create a fake account that can either be single use or used regularly. This of course means that a person is able to create a false persona and sign up for Facebook and the like using a browser's private function, and have access to accounts without someone else knowing.

This works both ways, from the point of view of the young person gaining access to a site they shouldn't and for someone who's creating accounts ready for grooming, or something similar. With access to a fake email, a young person has the potential get into a variety of potential dangerous situations. They could be contacted by someone who is trying to groom or send radicalised content, they could also become the subject of a hack and unwittingly execute code that can deploy a virus, ransomware or other malware, along with possible backdoor hacks to gain access to the system the young person is using.

So how would you, as a parent or guardian, combat potential email threats for children and young people? You may not be able to police their mobile accounts all the time but you can insist that they allow you access to the account on a regular basis to check that they're not in conversation with someone unknown, or that they're not receiving and responding to reams of spam and malware ridden emails. However, that does seem something of an Orwellian approach to managing a young person's email account.

Another possibility is to set up a family email account, separate from the parents or guardians' accounts, where the entire family has access and can utilise to sign up for games, safe sites and the like. It's a more open approach, whilst still preserving privacy for the adults and if you use folders within the email client or website, then there's some privacy for the young person too.

Answer the questions to the text:

1. How does the author describe email as a threat to online safety for young people and children?
2. What are some examples of fake email accounts that can be easily created?
3. How can someone use a fake email account to gain access to sites without others knowing?
4. What potential dangers can arise from a young person having access to a fake email account?

5. How can parents or guardians combat potential email threats for children and young people?

6. What is one suggestion the author gives for managing a young person's email account while still preserving privacy?

7. What is the author's opinion on monitoring a young person's email account?

TEXT 12.

A Child and Online Gaming, Is It Safe?

Gaming has taken some interesting leaps in technology since the day of feeding money into the arcade cabinets. However, with those advances comes a new level of online concerns for parents and guardians.

Of course, there's nothing wrong with gaming or online gaming. Despite the many years of people bemoaning that gaming is taking away something from a childhood, recent studies have actually shown that online gaming increase social skills, help develop hand-to-eye coordination and, depending on the game, have educational benefits and help young people learn.

The problem is that not everyone always plays fair; some take great offence when they've been beaten by another player, resulting in the person beaten shouting or entering abusive comments. Other players use cheats to gain an advantage, making it near impossible for other players to even have a chance of winning or succeeding. Sometimes, when a player is better than others around them, they can be accused of cheating, even when they're not.

There are other factors too that can cause problems for young people when gaming. The game itself might not be age appropriate, with in-game missions asking the young person to do something that's really not very nice. The game might involve some scenes of an inappropriate nature, perhaps sexually explicit or extremely violent, or use inappropriate language.

In-game spending is a modern cause for concern among parents too. For the young person who enjoys playing the game to have any significant advantage at all, they may need to purchase better items from the in-game store. Often these items will inevitably lead to more items needing purchasing and the cost soon mounts up. Other games make it near impossible to finish without having to pay for something, such as a key to unlock the next level or by having the player buy and download more content (known as a DLC, downloadable content).

As parents and guardians, we need to make sure that the game the young person is playing is appropriate and, to some degree, useful to them,

as well as being enjoyable. We'll look at some tips on staying safe when gaming online over the page but it's worth remembering that even if we find the game somewhat dull, the young person playing it may well be enjoying it. We just need to make sure it's a safe environment for them.

Choose the correct answer to the questions:

1. What benefits have recent studies shown about online gaming?

- A. Online gaming improves social skills and hand-to-eye coordination.
- B. Online gaming helps children learn and develop educational skills.
- C. Online gaming takes away something from childhood.
- D. Online gaming increases the risk of abusive comments.

2. What can happen when a player is accused of cheating in online gaming?

- A. The accused player is banned from the game.
- B. Other players rally behind the accused player.
- C. The accused player is reported to the game administrators.
- D. The accused player is often not actually cheating.

3. What are some potential problems with age-appropriate games?

- A. In-game missions that are unpleasant or mean-spirited.
- B. Scenes that are sexually explicit or extremely violent.
- C. Language that is inappropriate for young people.
- D. All of the above.

4. What is a cause for concern among parents regarding in-game spending?

- A. Young people may need to purchase better items from the in-game store.
- B. The cost of in-game items can quickly add up.
- C. Some games require additional purchases to unlock content or progress.
- D. All of the above.

5. What should parents and guardians consider when choosing a game for a young person?

- A. The game's appropriateness and usefulness.
- B. The game's popularity among other players.
- C. The game's level of difficulty.
- D. The parent's personal enjoyment of the game.

KEY-PATTERNS TO WRITE A SUMMARY

1. The title of the article/text.

The article/text is headlined...

The headline of the article/text I have read is . . .

2. The author of the article/text, where and when the article was published.

The author of the article is...

The author's name is ...

Unfortunately the author's name is not mentioned ...

The article is written by...

It was published in ... (on the Internet).

It is a newspaper (scientific) article (published on March 10, 2012 / in 2010).

3. The main idea of the article/text.

The main idea of the article is...

The article is about...

The article is devoted to...

The article deals (is concerned) with...

The article touches upon the issue of...

The purpose of the article is to give the reader some information on...

The aim of the article is to provide the reader with some material on...

4. The contents of the article. Some facts, names, figures.

The author starts by telling (the reader) that...

The author (of the article) writes (reports, states, stresses, thinks, notes, considers, believes, analyses, points out, says, describes) that... / draws reader's attention to...

Much attention is given to...

According to the article...

The article goes on to say that...

It is reported (shown, stressed) that ...

The article (text) can logically be divided into... .. parts. They are...

It is spoken in detail about...

From what the author says it becomes clear that...

The fact that ... is stressed.

The article gives a detailed analysis of...

Further the author reports (writes, states, stresses, thinks, notes, considers, believes, analyses, points out, says, describes) that... / draws reader's attention to. ...

5. Conclusion

In conclusion the author writes (reports, states, stresses, thinks, notes, considers, believes, analyses, points out, says, describes) that... / draws reader's attention to...

The author comes to the conclusion that...

The following conclusions are drawn: ...

VOCABULARY

A

1. access ['ækses] – доступ; иметь доступ
2. access error – ошибка доступа
3. accessory equipment – вспомогательные устройства
4. accuracy ['ækjəreɪ] – точность, правильность, четкость (изображения)
5. add [æd] – складывать
6. addict ['ædɪkt] – наркоман, заядлый любитель
7. addiction [ə'dɪkʃ(ə)n] – склонность к чему-л., пагубная привычка, зависимость
8. addition [ə'dɪʃ(ə)n] – сложение
9. anonymity – анонимность
10. an information-dependent society – информационно зависимое общество
11. application [ˌæplɪ'keɪʃ(ə)n] – применение, использование, приложение
12. application programmer – прикладной программист
13. application software – прикладное программное обеспечение
14. applied physics – прикладная физика
15. archival storage – архивное ЗУ; архивная память
16. arithmetic-logical unit – арифметико-логическое устройство
17. assemble [ə'sembl] – собирать, монтировать
18. at a rate – со скоростью
19. attachment [ə'tæʃmənt] – приложение к электронному письму
20. avatar [ˌævə'tɑː] – аватар

B

21. backup ['bækʌp] – резервная копия
22. binary digit ['baɪnəri 'dɪdʒɪt] – двоичная цифра; двоичный знак
23. branch of science – область науки
24. breach [briːʃ] – повреждение, нарушение
25. bug [bʌg] – ошибка, вирус

C

26. calculating device – вычислительное устройство
27. calculus ['kælkjʊləs] – исчисление, математический анализ
28. capability [ˌkeɪpə'bɪləti] – способность, возможность
29. capacity of storage – объем (емкость) памяти

30. carry out – выполнять, осуществлять
31. cashpoint ['kæʃpɔɪnt] – банкомат
32. command [kə'mɑ:nd] – команда
33. communications networks – сети передачи данных; сети связи
34. complete [kəm'pli:t] – выполнять
35. complex ['kɒmpleks] – сложный
36. computer engineering – вычислительная техника
37. computer literacy – компьютерная грамотность
38. computer virus – компьютерный вирус
39. computing – вычисление, счет, работа на компьютере
40. confidential [ˌkɒnfɪ'den(t)ʃ(ə)l] – конфиденциальный
41. continuous quantity – непрерывная величина
42. control unit – блок управления
43. convert ['kɒnvɜ:t] – преобразовывать, переводить в другие единицы
44. corrupt [kə'rʌpt] – испорченный, портить
45. cost-effective – экономичный
46. CPU (central processing unit) – центральный процессор
47. credit card fraud [frɔ:d] – мошенничество с кредитными картами
48. criminal ['krɪmɪn(ə)l] – преступный, преступник
49. crooked ['kruːkɪd] – добытый нечестным путем
50. crucial ['kru:ʃ(ə)l] – ключевой; критический, решающий
51. cyberaddict [ˌsaɪbə(r)ə'dɪkt] – человек, страдающий пагубным пристрастием к компьютеру
52. cyberattack [ˌsaɪbə(r)ə'tæk] – кибератака
53. cybercrime ['saɪbəˌkraɪm] – киберпреступность
54. cybersecurity [ˌsaɪbə'sɪ'kjʊərəti] – кибербезопасность
55. cyberspace [saɪbə(r)speɪs] – киберпространство

D

56. damage ['dæmɪdʒ] – ущерб, повреждение
57. data access time – время доступа к данным
58. data base – база данных
59. data breach ['deɪtə brɪ:tʃ] – утечка данных
60. data fault – ошибка в данных
61. data file – файл/картотека данных
62. data handling – обработка данных, работа с данными
63. data processing system – система обработки данных
64. data storage hierarchy – иерархия последовательность, порядок (следования)
65. delete [dɪ'li:t] – удалять, стирать
66. desktop computer – стационарный компьютер

67. digital age – цифровой век
68. digital computer – цифровой компьютер
69. digital generation – цифровое поколение
70. dimension [daɪ'men(t)ʃ(ə)n] – измерение
71. direct the operation – направлять работу
72. disk drive – дисковое запоминающее устройство
73. disorder [dɪ'sɔ:də] – беспорядок, нарушение
74. dispense [dɪ'spens] – раздавать; распределять
75. dispense money – выдавать деньги (*о банкомате*)
76. displace [dɪs'pleɪs] – перемещать, смещать
77. display [dɪs'pleɪ] – дисплей
78. divide [dɪ'vaɪd] делить
79. division [dɪ'vɪʒ(ə)n] – деление
80. donation [dəʊ'neɪʃ(ə)n] пожертвование
81. download ['daʊnləʊd] – загружать, скачивать
82. duplicator ['dju:plikeɪtə] – копировальное устройство

Е

83. electronic circuit – электронная цепь, схема
84. electronics [ˌelekt'rɒnɪks, ɪˌlek'-] – электроника
85. emerge [ɪ'mɜ:dʒ, ɪ:-] – появляться
86. emoticon [ɪ'məʊtɪˌkɒn] – эмотикон, смайлик
87. encrypt [ɛn'krɪpt] – кодировать
88. encryption [ɛn'krɪpʃn] – шифрование; кодирование; шифровка
89. enhance [ɪn'hɑ:n(t)s, en-] – усилить
90. enter – вводить данные; заносить, записывать
91. equipment [ɪ'kwɪpmənt] – оборудование
92. error handling – обработка ошибок
93. error trapping – ловушка для ошибок
94. error-prone – подверженный ошибкам
95. essential [ɪ'sen(t)ʃ(ə)l] – важнейший; необходимый; основной
96. execute applications programs – выполнять прикладные программы
97. expertise [ˌekspɜ:'ti:z, -spə-] – знание дела; квалификация, компе-

тентность

98. exploit ['eksplɔɪt] – использовать
99. extortion [ɪk'stɔ:ʃ(ə)n, ek-] – вымогание, вымогательство

F

100. feed (fed, fed) – подавать; питать; вводить (данные)
101. financial [faɪ'nænʃ(ə)l] loss – финансовые потери
102. financial transaction – финансовая операция
103. firewall ['faɪəwɔ:l] – брандмауэр, межсетевой экран

- 104. firewall breach ['faɪəwɔ:l bri:tʃ] – нарушение брандмауэра
- 105. firewall settings – настройки брандмауэра
- 106. firewall software ['sɒftweə] – программное обеспечение бранд-мауэра
- 107. firmware [fɜ:(r)mweəw(r)] – встроенное / микропроцессорное программное обеспечение
- 108. flip-flop – триггер
- 109. floppy (disk) – гибкий диск; ЗУ на гибком диске
- 110. fraud [frɔ:d] – обман; мошенничество, жульничество; подделка
- 111. fraudster ['frɔ:dstə] – жулик, мошенник
- 112. fraudulent ['frɔ:dʒələnt, -dʒə, -dʒu-, -dʒu:] – обманный; жульни-ческий, мошеннически

G

- 113. generation [ˌdʒenə'reɪʃ(ə)n] – создание, формирование, выработка
- 114. guise [gaɪz] – облик, личина, образ
- 115. hacker-proof ['hækəpru:f] – защищенный от хакеров
- 116. hacking ['hækɪŋ] I – хакерство
- 117. hardware ['hɑ:dweə] – “железо”, детали компьютера
- 118. help file – файл подсказок
- 119. hijack ['haɪdʒæk] – нападать с целью грабежа
- 120. household appliances – домашние приборы / устройства
- 121. hybrid computer – смешанного типа, аналого-цифровой ком-пьютер

I

- 122. identity theft [aɪ'dentəti] – кража личных данных
- 123. immediacy [ɪ'mi:diəsi] – непосредственность, прямота, открытость
- 124. inbox ['ɪnˌbɒks] почтовый ящик
- 125. increase reliability – увеличить надежность
- 126. indoor climate control system – система регуляции температуры в доме
- 127. industrial espionage [ɪn'dʌstriəl 'espɪənsɪz] – производственный шпионаж
- 128. initialise [ɪ'nɪʃ(ə)laɪz] – инициализировать
- 129. input – ввод
- 130. input / to feed in – вводить (информацию)
- 131. input device – устройство ввода
- 132. install – устанавливать; размещать; монтировать; настраивать
- 133. instant response – мгновенный ответ
- 134. instantaneously [ˌɪn(t)stən'teɪniəsli] – мгновенно, немедленно
- 135. instruction – команда, инструкция, указание

- 136. integrated circuit (IC) – интегральная схема
- 137. interactive whiteboard – интерактивная доска
- 138. intermediate results – промежуточные результаты
- 139. internal storage – внутреннее ЗУ
- 140. intricate – сложный, запутанный
- 141. invalid data – неверные, неправильные, недопустимые данные
- 142. invention [ɪn'venʃ(ə)n] создание изобретение
- 143. inventory control – инвентаризация, переучет
- 144. invisible to unaided eye – невидимый невооруженному глазу
- 145. issue commands – выдавать команды

К

- 146. keep one's guard [gɑ:d] up – быть настороже
- 147. keyboard ['ki:bɔ:d] – клавиатура
- 148. keyboard terminals – терминал (ввод) с клавишным управлением

L

- 149. large-scale integrated circuit – большая интегральная схема
- 150. legitimate [lɪ'dʒɪtəmət] – законный, легальный; легитимный
- 151. list of instructions – перечень команд
- 152. log in – зарегистрироваться
- 153. log on – входить (в систему)
- 154. logic gates – логический элемент; схема пропускания (сигналов); проход

М

- 155. main storage – основная память
- 156. mainframe – универсальная ЭВМ
- 157. make decisions – принимать решения
- 158. make errors – допускать ошибки (погрешности)
- 159. make voice calls – совершать голосовые звонки
- 160. malware ['mælwɛə] – вредоносное ПО
- 161. manipulate [mə'nɪpjəleɪt] – управлять; обращаться; преобразовывать
- 162. manual ['mænjuəl] – ручной, выполняемый вручную
- 163. means of coding – средства кодировки
- 164. mechanical brain – механический мозг
- 165. medium-scale integrated circuit – средняя интегральная схема
- 166. memory ['mem(ə)rɪ] – память
- 167. mode [məʊd] – вид, метод, способ
- 168. modem ['məʊdem] – модем
- 169. monitor ['mɒnɪtə] – монитор, экран
- 170. mouse – мышка

171. multimedia attachment – мультимедийное приложение к электронному письму

172. multiple ['mʌltɪpl] – кратный

173. multiplication [ˌmʌltɪplɪ'keɪʃ(ə)n] – умножение

174. multiply [mʌ'npjəleɪt] – умножать

175. network ['netwɜ:k] – сеть

О

176. offline storage – автономное хранение данных отдельно от компьютера

177. on-going process – непрерывный процесс

178. on-line banking – банковское обслуживание через интернет

179. online safety ['seɪftɪ] – безопасность в сети

180. on-line sales – интернет-продажи

181. online shopping – покупки в Интернете

182. online storage – неавтономное хранение данных в ЗУ

183. on-line translation – онлайн-перевод

184. operate switches – приводить в действие переключатели

185. operation – операция; работа; действие; срабатывание

186. output ['aʊtput] – вывод

Р

187. pattern – шаблон, образец

188. PDA (personal digital assistant) – персональный цифровой секретарь (карманный компьютер)

189. per bit – на единицу информации

190. performance – рабочая характеристика

191. peripherals [pə'rɪf(ə)r(ə)lɜ:] – периферийное оборудование

192. personal information – личная информация

193. phenomena [fɪ'nɒmɪnə] – явления

194. phenomenon [fɪ'nɒmɪnən] – явление

195. phishing ['fɪʃɪŋ] – фишинг, вид интернет-мошенничества

196. photocell ['fəʊtəʊsɛl] – фотоэлемент

197. plug in – подключать, подсоединять

198. portable ['pɔ:təbl] – портативный, переносный

199. power ['paʊə] – мощность, энергия

200. power consumption – потребление электроэнергии

201. powerline adapter ['paʊəlaɪn ə'dæptə] – сетевой адаптер

202. prevalent ['prev(ə)lənt] – распространённый, общепринятый

203. primary / secondary storage – первичное / вторичное запоминающее устройство

204. printer – принтер

205. problem-solving device – устройство, обеспечивающее решение задачи

206. process [prə'ses] – обрабатывать

207. process data – обрабатывать данные

208. product line – серия (компьютерных) продуктов

209. program, routine – программа

210. programming rules – правила программирования

211. proliferation – размножение, быстрое увеличение

212. protection [prə'tekʃ(ə)n] – защита

213. protective measures [prə'tektiv 'meʒə] – защитные меры

214. pseudocode [,sju:'dəu'k əud] – псевдокод, псевдограмма

215. punched card – перфокарта

R

216. radar system – радиолокационная система

217. radiant energy – энергия излучения

218. random-access memory (RAM) – оперативное запоминающее устройство (ОЗУ)

219. ransomware ['ræn(t)s(ə)m weə] – программа-вымогатель

220. read the information into the computer – вводить информацию в компьютер

221. read-only memory (ROM) – постоянное запоминающее устройство (ПЗУ)

222. release [rɪ'li:s] – избавлять, освобождать

223. remote access [rɪ'məut 'ækses] – удалённый доступ

224. request [rɪ'kwest] – запрос, просьба

225. research [rɪ'sɜ:tʃ] – (научное) исследование; изучение; исследовательская работа

226. room – свободная память

S

227. safeguards ['seɪfɡɑ:dʒ] – меры безопасности

228. scam [skæm] – афера, жульничество, мошенничество

229. science fiction ['saɪəns 'fɪkʃ(ə)n] – научная фантастика

230. screen – экран

231. search engine [sɜ:tʃ 'endʒɪn] – поисковая система

232. security [sɪ'kjuərəti] – безопасность

233. security breach [sɪ'kjuərəti bri:tʃ] – нарушение безопасности

234. security patch – патч для устранения ошибок защиты

235. security suites [sɪ'kjuərəti [swi:ts] – пакеты безопасности

236. security threat [sɪ'kjuərəti θret] – угроза безопасности

237. set – набор, множество

238. setting ['setɪŋ] – окружающая обстановка, художественное оформление

239. sign – знак

240. simulate – моделировать

241. simulated ['sɪmjəleɪtɪd] – поддельный, фальшивый

242. social media post – публикация в социальных сетях

243. software – программное обеспечение

244. solar battery – солнечная батарея

245. spam [spæm] – спам

246. speed of response – скорость реакции

247. storage device – накопитель; запоминающее устройство

248. store – хранить

249. store numbers – запоминать числа

250. strings of characters – последовательность символов

251. sub-headings [sʌb'hedɪŋ] – подзаголовок

252. substantially [səb'stæn(t)ʃ(ə)lɪ] – существенно, в значительной степени

253. subtract – вычитать

254. subtraction – вычитание

255. supply [sə'plaɪ] – подавать, вводить, снабжать обеспечивать

256. swindle ['swɪndl] – обманывать, надувать

257. symbol ['sɪmb(ə)l] – символ

258. system software – системное программное обеспечение

Т

259. tape drive – запоминающее устройство на магнитной ленте

260. tech-savvy ['sævɪ] – технически подкованный

261. telepresence ['teləˌprezəns] – телеприсутствие

262. text manipulation – обработка текста

263. threat [θret] – опасность, угроза

264. three-dimensional [ˌθriːdɪ'men(t)ʃ(ə)n(ə)l] – трёхмерный

265. to block – блокировать

266. to bookmark a website – добавить сайт в закладки

267. to hack into an account [ə'kaʊnt] – взломать учетную запись

268. to keep track – отследить

269. to monitor ['mɒnɪtə] – контролировать

270. to protect [prə'tekt] – защищать

271. to restrict [rɪ'strɪkt] – ограничивать

272. to steal someone's identity – украсть чью-либо личность

273. transfer [træn(t)s'fɜː, trɑːn-] – передавать(ся); переносить(ся); пересылать(ся)

274. transfer money – переводить деньги

275. transformation [ˌtræn(t)sfə'meɪʃ(ə)n, ˌtrɑːn-] – изменение, преобразование

276. transmission line – линия передачи

277. transmit [trænz'mɪt] – передавать, отправлять, пересылать

278. turn off = to switch off – выключать

279. turn on = to switch on – включать

280. type [taɪp] – печатать

U

281. unauthorized [ʌn'ɔːθ(ə)raɪzd] – запрещённый, несанкционированный

282. unauthorized access [ʌn'ɔːθ(ə)raɪzd 'ækses] – несанкционированный доступ

283. unit of data – единица информации

284. update [ʌp'det] – обновление

285. upload [ʌpləʊd] – выкладывать в интернет

286. user ['juːzə] – пользователь

287. user file – файл пользователя

288. user interface – пользовательский интерфейс

V

289. verify ['verɪfaɪ] – проверять, контролировать

290. victim ['vɪktɪm] – жертва

291. virtual ['vɜːtʃuəl, -tʃu-] – виртуальный

292. vulnerable ['vʌln(ə)rəbl] уязвимый; ранимый password

W

293. warning ['wɔːnɪŋ] – предупреждение; предостережение

294. water-tight [wɔːtə(r)taɪt] – водонепроницаемый

295. webcam ['webkæm] – веб-камера

296. webpage – страница в интернете

297. Wi-Fi coverage [ˌwaɪ'faɪ 'klʌv(ə)rɪdʒ] – покрытие Wi-Fi

298. wire ['waɪə] – провод

299. wireless ['waɪələs] – беспроводной
